Grammars and Parsing

Recap

Grammars

Examples of context-free grammars

Ambiguity

Parsing, concrete and abstract syntax

Universiteit Utrecht

2.1 Recap

Universiteit Utrecht

2-3

Previous lecture

Alphabet A finite set of symbols.

Language A set of words/sentences, i.e., sequences of symbols from the alphabet.

We have discussed different ways to define languages:

by enumerating all elements,

- using a predicate,
- using an inductive definition

Universiteit Utrecht

Example: palindromes

The language of palindromes PAL is defined as follows:

 \blacktriangleright ε is in PAL,

a, b, c are in PAL,

▶ if P is in PAL, then aPa, bPb and cPc are also in PAL.

Universiteit Utrecht

2.2 Grammars

Universiteit Utrecht

2-6

A grammar is a formalism to describe a language inductively. Grammars consist of rewrite rules, called **productions**.

Universiteit Utrecht

A grammar for palindromes

$$P \rightarrow \varepsilon$$

$$P \rightarrow a$$

$$P \rightarrow b$$

$$P \rightarrow c$$

$$P \rightarrow aPa$$

$$P \rightarrow bPb$$

$$P \rightarrow cPc$$

The language of palindromes PAL is defined as follows:

- \blacktriangleright ε is in PAL,
- a, b, c are in PAL,
- if P is in PAL, then aPa, bPb and cPc are also in PAL.

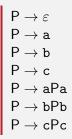

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

イロト 不得 トイヨト イヨト 三日

A grammar for palindromes

 $\begin{array}{lll} \mathsf{P} \rightarrow \varepsilon & & \text{The language of palindromes PAL is defined as} \\ \mathsf{P} \rightarrow \mathsf{a} & & \text{follows:} \\ \mathsf{P} \rightarrow \mathsf{b} & \blacktriangleright \varepsilon \text{ is in PAL}, \\ \mathsf{P} \rightarrow \mathsf{c} & \blacktriangleright \mathsf{a}, \mathsf{b}, \mathsf{c} \text{ are in PAL}, \\ \mathsf{P} \rightarrow \mathsf{aPa} & \blacktriangleright \mathsf{a}, \mathsf{b}, \mathsf{c} \text{ are in PAL}, \\ \mathsf{P} \rightarrow \mathsf{bPb} & \vdash \text{ if P is in PAL, then aPa, bPb and cPc are} \\ \mathsf{P} \rightarrow \mathsf{cPc} & & \text{also in PAL}. \end{array}$

Very close to the inductive definition.

Universiteit Utrecht

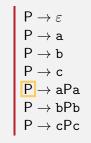

Faculty of Science Information and Computing Sciences ◆□ > ◆昼 > ◆臣 > ◆臣 > ○臣 ● ���

 $\begin{array}{c} \mathsf{P} \rightarrow \varepsilon \\ \mathsf{P} \rightarrow \mathbf{a} \\ \mathsf{P} \rightarrow \mathbf{b} \\ \mathsf{P} \rightarrow \mathbf{c} \\ \hline \mathsf{P} \rightarrow \mathbf{a} \mathsf{P} \mathbf{a} \\ \mathsf{P} \rightarrow \mathbf{b} \mathsf{P} \mathbf{b} \\ \mathsf{P} \rightarrow \mathbf{c} \mathsf{P} \mathbf{c} \end{array}$

A grammar consists of multiple productions. Productions can be seen as rewrite rules. If the left hand side matches, it can be replaced by the right hand side.

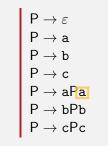

Universiteit Utrecht

- A grammar consists of multiple productions. Productions can be seen as rewrite rules. If the left hand side matches, it can be replaced by the right hand side.
- The grammar makes use of auxiliary symbols – called nonterminals – that are not part of the alphabet and hence cannot be part of the final word/sentence.

Universiteit Utrecht

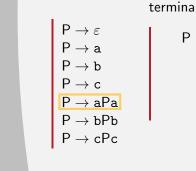

- A grammar consists of multiple productions. Productions can be seen as rewrite rules. If the left hand side matches, it can be replaced by the right hand side.
- The grammar makes use of auxiliary symbols – called nonterminals – that are not part of the alphabet and hence cannot be part of the final word/sentence.
- The symbols from the alphabet are also called terminals.

2-10

Starting from a nonterminal, we can rewrite successively until we reach a string of terminals:

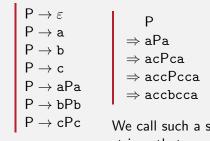

Faculty of Science Information and Computing Sciences]

・ロト・日本・日本・日本・日本・日本

Starting from a nonterminal, we can rewrite successively until we reach a string of terminals:

We call such a sequence a derivation. All strings that can be derived from a nonterminal are in the language generated by the nonterminal.

Faculty of Science Information and Computing Sciences

・ロト・日本・日本・日本・日本・日本

Grammars can have multiple nonterminals:

$$\begin{array}{l} S \rightarrow A \\ S \rightarrow B \\ A \rightarrow c \\ A \rightarrow AA \\ B \rightarrow d \\ B \rightarrow BB \end{array}$$

Universiteit Utrecht

Grammars can have multiple nonterminals:

$$\begin{array}{l} S \rightarrow A \\ S \rightarrow B \\ A \rightarrow c \\ A \rightarrow AA \\ B \rightarrow d \\ B \rightarrow BB \end{array}$$

One nonterminal in the grammar is called the start symbol.

Universiteit Utrecht

Grammars can have multiple nonterminals:

$$\begin{array}{c} \mathsf{S} \rightarrow \mathsf{A} \\ \mathsf{S} \rightarrow \mathsf{B} \\ \mathsf{A} \rightarrow \mathsf{c} \\ \mathsf{A} \rightarrow \mathsf{AA} \\ \mathsf{B} \rightarrow \mathsf{d} \\ \mathsf{B} \rightarrow \mathsf{BB} \end{array}$$

One nonterminal in the grammar is called the start symbol.

If not otherwise mentioned, we implicitly assume that the nonterminal on the left hand side of the first production is the start symbol (and we often, but not always, call it 'S').

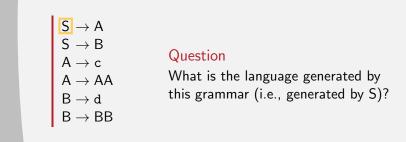

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

イロト 不得 トイヨト イヨト 三日

Context-free grammars

The grammars we consider are restricted:

the left hand side of a production always consists of a single nonterminal

Grammars with this restriction are called context-free.

Universiteit Utrecht

Remarks about grammars

- Not all languages can be generated/described by a grammar.
- Multiple grammars may describe the same language.
- Grammars which generate the same language are equivalent.
- Even fewer languages can be described by a context-free grammar.
- Languages that can be described by a context-free grammar are called context-free languages.
- Context-free languages are relatively easy to deal with algorithmically, and therefore most programming languages are context-free languages.

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

*ロト * 得 * * ミト * ミト ・ ミー ・ つくや

Multiple grammars for one language

$$\begin{array}{|c|c|c|c|c|c|} S \rightarrow aS & S \rightarrow Sa & S \rightarrow SS & S \rightarrow AS \\ S \rightarrow a & S \rightarrow a & S \rightarrow a & S \rightarrow AS \\ S \rightarrow a & S \rightarrow Aa & A \rightarrow a \end{array}$$

[Faculty of Science Information and Computing Sciences]

2-14

2.3 Examples of context-free grammars

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

2-15

Language of (single) digits

$$\begin{array}{l} \text{Dig} \rightarrow 0 \\ \text{Dig} \rightarrow 1 \\ \text{Dig} \rightarrow 2 \\ \text{Dig} \rightarrow 3 \\ \text{Dig} \rightarrow 4 \\ \text{Dig} \rightarrow 5 \\ \text{Dig} \rightarrow 6 \\ \text{Dig} \rightarrow 7 \\ \text{Dig} \rightarrow 8 \\ \text{Dig} \rightarrow 9 \end{array}$$

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

- * ロ > * 母 > * ミ > * ミ > - ミ ・ の < や

Language of (single) digits

$$\begin{array}{l} \text{Dig} \rightarrow 0 \\ \text{Dig} \rightarrow 1 \\ \text{Dig} \rightarrow 2 \\ \text{Dig} \rightarrow 3 \\ \text{Dig} \rightarrow 4 \\ \text{Dig} \rightarrow 5 \\ \text{Dig} \rightarrow 6 \\ \text{Dig} \rightarrow 7 \\ \text{Dig} \rightarrow 8 \\ \text{Dig} \rightarrow 9 \end{array}$$

Multiple productions for the same nonterminal can be joined:

 $\mathsf{Dig} \to 0 \,|\, 1 \,|\, 2 \,|\, 3 \,|\, 4 \,|\, 5 \,|\, 6 \,|\, 7 \,|\, 8 \,|\, 9$

(We still count ten productions!)

Sequences of digits

```
\mathsf{Digs} \to \varepsilon \mid \mathsf{Dig} \mathsf{ Digs}
```

Universiteit Utrecht

Sequences of digits

 $\mathsf{Digs} \to \varepsilon \mid \mathsf{Dig} \; \mathsf{Digs}$

This grammar allows sequences with leading zeros:

 $\begin{array}{l} \mathsf{Digs} \Rightarrow \mathsf{Dig} \; \mathsf{Digs} \Rightarrow \mathsf{Dig} \; \mathsf{D$

The symbol ' \Rightarrow *' means that we make multiple (zero or more, but finitely many) derivation steps at once.

Universiteit Utrecht

Sequences of digits

 $\mathsf{Digs} \to \varepsilon \mid \mathsf{Dig} \; \mathsf{Digs}$

This grammar allows sequences with leading zeros:

 $\begin{array}{l} \mathsf{Digs} \Rightarrow \mathsf{Dig} \; \mathsf{Digs} \Rightarrow \mathsf{Dig} \; \mathsf{D$

The symbol ' \Rightarrow *' means that we make multiple (zero or more, but finitely many) derivation steps at once.

We also allow the star notation on the right hand side of a grammar to abbreviate zero or more occurrences of symbols:

$$\mathsf{Digs} \to \mathsf{Dig}^*$$

Universiteit Utrecht

Natural numbers

To disallow leading zeros we introduce another nonterminal:

 $\mathsf{Dig-0} \to \mathsf{1} \ | \ \mathsf{2} \ | \ \mathsf{3} \ | \ \mathsf{4} \ | \ \mathsf{5} \ | \ \mathsf{6} \ | \ \mathsf{7} \ | \ \mathsf{8} \ | \ \mathsf{9}$

Universiteit Utrecht

Natural numbers

```
To disallow leading zeros we introduce another nonterminal:
```

```
\mathsf{Dig-0} \to \mathsf{1} \ | \ \mathsf{2} \ | \ \mathsf{3} \ | \ \mathsf{4} \ | \ \mathsf{5} \ | \ \mathsf{6} \ | \ \mathsf{7} \ | \ \mathsf{8} \ | \ \mathsf{9}
```

```
Nat \rightarrow 0 | Dig-0 Digs
```

Universiteit Utrecht

Integers

$$\begin{array}{l} \mathsf{Sign} \to \mathsf{+} \mid \mathsf{-} \\ \mathsf{Int} \quad \to \mathsf{Sign} \; \mathsf{Nat} \mid \mathsf{Nat} \end{array}$$

The sign is optional.

Universiteit Utrecht

Integers

```
\begin{array}{l} \mathsf{Sign} \to \mathsf{+} \mid \mathsf{-} \\ \mathsf{Int} \quad \to \mathsf{Sign} \,\, \mathsf{Nat} \mid \mathsf{Nat} \end{array}
```

The sign is optional.

There is an abbreviation for optional symbols as well:

```
\mathsf{Int} \to \mathsf{Sign}? \; \mathsf{Nat}
```

Universiteit Utrecht

Letters

Letters are much like digits.

```
\begin{array}{l} \mathsf{SLetter} \rightarrow \mathtt{a} \, | \, \mathtt{b} \, | \ldots | \, \mathtt{z} \\ \mathsf{CLetter} \rightarrow \mathtt{A} \, | \, \mathtt{B} \, | \ldots | \, \mathtt{Z} \end{array}
```

(52 productions in total.)

Universiteit Utrecht

Letters

```
Letters are much like digits.
```

```
\begin{array}{l} \mathsf{SLetter} \rightarrow \mathsf{a} \mid \mathsf{b} \mid \ldots \mid \mathsf{z} \\ \mathsf{CLetter} \rightarrow \mathsf{A} \mid \mathsf{B} \mid \ldots \mid \mathsf{Z} \end{array}
```

(52 productions in total.)

Letter ightarrow SLetter | CLetter

Universiteit Utrecht

Identifiers

In many languages, identifiers must not start with a number, but can have numbers following an initial letter.

```
\begin{array}{ll} \mathsf{AlphaNum} \rightarrow \mathsf{Letter} \mid \mathsf{Dig} \\ \mathsf{Identifier} & \rightarrow \mathsf{SLetter} \; \mathsf{AlphaNum}^* \end{array}
```

Variations are easy to define (such as allowing certain symbols, for example '_', as well).

Universiteit Utrecht

A fragment of C#

```
\begin{array}{l} \mathsf{Stat} \to \mathsf{Var} = \mathsf{Expr} \ ; \\ & \mid \ \mathsf{if} \ ( \ \mathsf{Expr} \ ) \ \mathsf{Stat} \ \mathsf{else} \ \mathsf{Stat} \\ & \mid \ \mathsf{while} \ ( \ \mathsf{Expr} \ ) \ \mathsf{Stat} \\ \end{array}
\begin{array}{l} \mathsf{Expr} \to \mathsf{Integer} \\ & \mid \ \mathsf{Var} \\ & \mid \ \mathsf{Expr} \ \mathsf{Op} \ \mathsf{Expr} \\ \end{array}
\begin{array}{l} \mathsf{Var} \\ \mathsf{Var} \\ \to \mathsf{Identifier} \\ \mathsf{Op} \ \to \mathsf{Sign} \ | \ \ast \end{array}
```

Universiteit Utrecht

2.4 Ambiguity

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

2-23

Multiple derivations for one sentence

Consider the grammar:

$$\begin{array}{c} \mathsf{S} \to \mathsf{SS} \\ \mathsf{S} \to \mathtt{a} \end{array}$$

These are three derivations of aaa:

$$\mathsf{S} \Rightarrow \mathsf{SS} \Rightarrow \mathsf{aS} \Rightarrow \mathsf{aSS} \Rightarrow \mathsf{aSa} \Rightarrow \mathsf{aaa}$$
 (1)

$$S \Rightarrow SS \Rightarrow aS \Rightarrow aSS \Rightarrow aaS \Rightarrow aaa$$
 (2)

$$S \Rightarrow SS \Rightarrow Sa \Rightarrow SSa \Rightarrow aSa \Rightarrow aaa$$
 (3)

[Faculty of Science Information and Computing Sciences]

2-24

Multiple derivations for one sentence

Consider the grammar:

$$S \rightarrow SS$$

 $S \rightarrow a$

These are three derivations of aaa:

$$S \Rightarrow SS \Rightarrow aS \Rightarrow aSS \Rightarrow aSa \Rightarrow aaa$$
 (1)

$$S \Rightarrow SS \Rightarrow aS \Rightarrow aSS \Rightarrow aaS \Rightarrow aaa$$
 (2)

$$S \Rightarrow SS \Rightarrow Sa \Rightarrow SSa \Rightarrow aSa \Rightarrow aaa$$
 (3)

Question

Why is (3) fundamentally different from (1) and (2)?

Universiteit Utrecht

Ambiguity

A grammar where every sentence corresponds to a unique parse tree is called **unambiguous**.

If this is not the case, the grammar is called **ambiguous**.

Universiteit Utrecht

Ambiguity

A grammar where every sentence corresponds to a unique parse tree is called **unambiguous**.

If this is not the case, the grammar is called **ambiguous**.

The grammar

$$\begin{array}{c} S \rightarrow SS \\ S \rightarrow a \end{array}$$

is thus ambiguous.

Universiteit Utrecht

Ambiguity

A grammar where every sentence corresponds to a unique parse tree is called **unambiguous**.

If this is not the case, the grammar is called **ambiguous**.

The grammar

$$\begin{array}{c} S \rightarrow SS \\ S \rightarrow a \end{array}$$

is thus ambiguous.

Question

Why are ambiguous grammars bad?

Universiteit Utrecht

Ambiguity and semantics

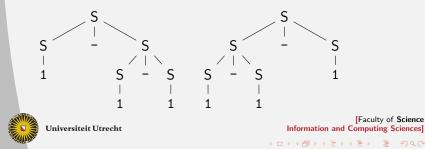

Let's look ahead for a moment. Later we are going to assign **semantics** to parse trees.

Assume the (ambiguous) grammar:

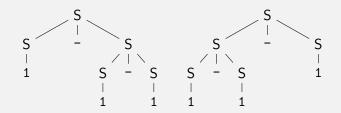

$$S \rightarrow S-S$$

 $S \rightarrow 1$

Now the sentence 1–1–1 corresponds to two parse trees:

Ambiguity and semantics – contd.

Using the standard semantics,

the left tree corresponds to the value 1,

▶ the right tree corresponds to the value -1.

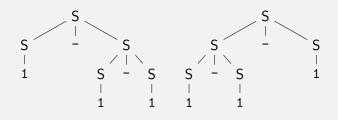

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

-

くロンス 行い くうとく ラント

Ambiguity and semantics – contd.

Using the standard semantics,

the left tree corresponds to the value 1,

▶ the right tree corresponds to the value -1.

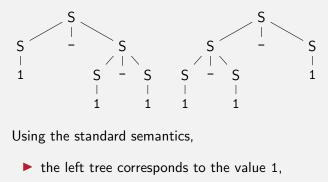

Hence, ambiguous grammars lead to ambiguous semantics.

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

Ambiguity and semantics – contd.

► the right tree corresponds to the value -1.

Hence, **ambiguous grammars lead to ambiguous semantics**. Later, we will also see that ambiguous grammars can cause

inefficiency.

Words of warning: syntax vs. semantics

Do not immediately associate semantics with a sentence:

1-1-1

A language defines which sentences are syntactically correct. Assigning meaning to these sentences is a separate step.

Universiteit Utrecht

Words of warning: syntax vs. semantics

Do not immediately associate semantics with a sentence:

1-1-1

A language defines which sentences are syntactically correct. Assigning meaning to these sentences is a separate step.

Depending on the semantics we assign, a string such as 1-1-1 can have many different meanings:

- \blacktriangleright it could mean the value 1 or -1,
- it could mean the 1st of January in year 1,
- it could mean that the first item in a table should be copied three times,

イロト 不得 トイヨト イヨト 三日

A grammar transformation is a mapping from one grammar to another, such that the generated language remains the same.

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

2-31

A grammar transformation is a mapping from one grammar to another, such that the generated language remains the same. Formally:

A grammar transformation maps a grammar G to another grammar G' such that

 $L(\mathsf{G}) = L(\mathsf{G}')$

Universiteit Utrecht

A grammar transformation is a mapping from one grammar to another, such that the generated language remains the same. Formally:

A grammar transformation maps a grammar G to another grammar G' such that

$$L(\mathsf{G}) = L(\mathsf{G}')$$

Grammar transformations can help us to transform grammars with undesirable properties (such as ambiguity) into grammars with other (hopefully better) properties.

Universiteit Utrecht

A grammar transformation is a mapping from one grammar to another, such that the generated language remains the same. Formally:

A grammar transformation maps a grammar G to another grammar G' such that

$$L(\mathsf{G}) = L(\mathsf{G}')$$

Grammar transformations can help us to transform grammars with undesirable properties (such as ambiguity) into grammars with other (hopefully better) properties.

Most grammar transformations are motivated by facilitating parsing.

Universiteit Utrecht

2.5 Parsing, concrete and abstract syntax

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

2-32

Parsing problem

Given a grammar G and a string s, the parsing problem is to decide whether or not $s \in L(G)$.

Universiteit Utrecht

Parsing problem

Given a grammar G and a string s, the parsing problem is to decide whether or not $s \in L(G)$.

Furthermore, if $\mathsf{s}\in L(\mathsf{G}),$ we want evidence/proof/an explanation why this is the case, usually in the form of a parse tree.

Universiteit Utrecht

Parse trees in Haskell

Consider this grammar (What is the language? Is it ambiguous?)

$$\begin{array}{c} \mathsf{S} \ \rightarrow \mathsf{S}\text{-}\mathsf{D} \mid \mathsf{D} \\ \mathsf{D} \rightarrow \mathsf{0} \mid \mathtt{1} \end{array}$$

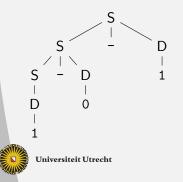

Universiteit Utrecht

Parse trees in Haskell

Consider this grammar (What is the language? Is it ambiguous?)

$$\begin{array}{c} \mathsf{S} \ \rightarrow \ \mathsf{S}\text{-}\mathsf{D} \mid \mathsf{D} \\ \mathsf{D} \ \rightarrow \ \mathsf{0} \mid \mathsf{1} \end{array}$$

The string 1-0-1 corresponds to the parse tree

Idea

Let us represent nonterminals as datatypes:

Universiteit Utrecht

Idea

Let us represent nonterminals as datatypes:

In every node of the parse tree, we have a choice between one of the productions for the nonterminal in question.

Universiteit Utrecht

Idea

Let us represent nonterminals as datatypes:

- In every node of the parse tree, we have a choice between one of the productions for the nonterminal in question.
- If we want to build a value of a Haskell datatype, we have a choice between any of that datatype's constructors.

Idea

Let us represent nonterminals as datatypes:

- In every node of the parse tree, we have a choice between one of the productions for the nonterminal in question.
- If we want to build a value of a Haskell datatype, we have a choice between any of that datatype's constructors.

Hence, productions become constructors.

Universiteit Utrecht

$$\begin{array}{lll} S \rightarrow S\text{-}D \mid D & \mbox{data} \; S = \dots & & | \; \dots \\ D \rightarrow 0 \mid 1 & \mbox{data} \; D = \dots & & & | \; \dots \end{array}$$

What names to choose for the constructors?

Universiteit Utrecht

$$\begin{array}{lll} S \rightarrow S\text{-}D \mid D & \mbox{data} \; S = \dots & & | \; \dots \\ D \rightarrow 0 \mid 1 & \mbox{data} \; D = \dots & & | \; \dots \end{array}$$

What names to choose for the constructors? – Our choice, but let's try to pick somewhat meaningful names.

Universiteit Utrecht

$$\begin{array}{lll} S \rightarrow S\text{-}D \mid D & \mbox{data} \; S = Minus \; \dots & \mbox{|SingleDigit} \; \dots \\ D \rightarrow 0 \mid 1 & \mbox{data} \; D = Zero \; \dots & \mbox{|One} \; \dots \end{array}$$

What names to choose for the constructors? – Our choice, but let's try to pick somewhat meaningful names.

And what do we do for each of the nonterminals on the right hand sides of the productions?

$$\begin{array}{lll} S \rightarrow S\text{-}D \mid D & \mbox{data} \; S = Minus \; \dots & \mbox{|SingleDigit} \; \dots \\ D \rightarrow 0 \mid 1 & \mbox{data} \; D = Zero \; \dots & \mbox{|One} \; \dots \end{array}$$

What names to choose for the constructors? – Our choice, but let's try to pick somewhat meaningful names.

And what do we do for each of the nonterminals on the right hand sides of the productions? – They become arguments of the constructor.

Universiteit Utrecht

 $\begin{array}{|c|c|c|c|c|c|c|c|} S \rightarrow S\text{-}D \mid D & \mbox{data} \ S = Minus \ S \ \dots \ D \mid SingleDigit \ D \\ \hline D \rightarrow 0 \mid 1 & \mbox{data} \ D = Zero \ \dots & \mid One \ \dots \end{array}$

What names to choose for the constructors? – Our choice, but let's try to pick somewhat meaningful names.

And what do we do for each of the nonterminals on the right hand sides of the productions? – They become arguments of the constructor.

And what do we do with the terminals on the right hand sides of the productions?

Universiteit Utrecht

 $\begin{array}{|c|c|c|c|c|c|c|c|} S \rightarrow S\text{-}D \mid D & \mbox{data} \ S = Minus \ S \ \dots \ D \mid SingleDigit \ D \\ \hline D \rightarrow 0 \mid 1 & \mbox{data} \ D = Zero \ \dots & \mid One \ \dots \end{array}$

What names to choose for the constructors? – Our choice, but let's try to pick somewhat meaningful names.

And what do we do for each of the nonterminals on the right hand sides of the productions? – They become arguments of the constructor.

And what do we do with the terminals on the right hand sides of the productions? – Do we actually need them?

Universiteit Utrecht

What names to choose for the constructors? – Our choice, but let's try to pick somewhat meaningful names.

And what do we do for each of the nonterminals on the right hand sides of the productions? – They become arguments of the constructor.

And what do we do with the terminals on the right hand sides of the productions? – Do we actually need them? – No, the choice of the constructor already contains enough information to **reconstruct** the terminals.

Concrete and abstract syntax

The grammar and the datatype describe the language. **concrete: abstract** syntax:

 $\begin{array}{|c|c|c|c|c|} S \rightarrow S\text{-}D \mid D & \mbox{data } S = Minus \ S \ D \mid SingleDigit \ D \\ \hline D \rightarrow 0 \mid 1 & \mbox{data } D = Zero \mid One \end{array}$

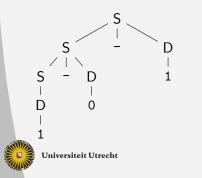

Universiteit Utrecht

Concrete and abstract syntax

The grammar and the datatype describe the language. **concrete**: **abstract** syntax:

 $\begin{array}{|c|c|c|c|c|} S \rightarrow S\text{-}D \mid D & \textbf{data} \ S = \text{Minus S } D \mid \text{SingleDigit } D \\ D \rightarrow 0 \mid 1 & \textbf{data} \ D = \text{Zero} \mid \text{One} \end{array}$

The string 1-0-1 corresponds to the parse tree

Haskell

Minus (Minus (SingleDigit One) Zero) One
