7. Compositional interpreters for expressions

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

7-1

This lecture

Compositional interpreters for expressions

Reminder: simple expressions

Variables

Definitions

Mutually recursive datatypes: declarations and expressions

Using a list of declarations

Use before definition

Universiteit Utrecht

7.1 Reminder: simple expressions

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

7-3

Simple expressions

Unit

Universiteit Utrecht

Evaluation

Directly:

```
 \begin{array}{l} \mathsf{eval} :: \mathsf{E} \to \mathsf{Int} \\ \mathsf{eval} \; (\mathsf{Add} \; \mathsf{e}_1 \; \mathsf{e}_2) = \mathsf{eval} \; \mathsf{e}_1 + \mathsf{eval} \; \mathsf{e}_2 \\ \mathsf{eval} \; (\mathsf{Neg} \; \mathsf{e}) &= \mathsf{negate} \; (\mathsf{eval} \; \mathsf{e}) \\ \mathsf{eval} \; (\mathsf{Num} \; \mathsf{n}) &= \mathsf{n} \end{array}
```

Universiteit Utrecht

Evaluation

Directly:

```
 \begin{array}{l} \mathsf{eval} :: \mathsf{E} \to \mathsf{Int} \\ \mathsf{eval} \; (\mathsf{Add} \; \mathsf{e}_1 \; \mathsf{e}_2) = \mathsf{eval} \; \mathsf{e}_1 + \mathsf{eval} \; \mathsf{e}_2 \\ \mathsf{eval} \; (\mathsf{Neg} \; \mathsf{e}) &= \mathsf{negate} \; (\mathsf{eval} \; \mathsf{e}) \\ \mathsf{eval} \; (\mathsf{Num} \; \mathsf{n}) &= \mathsf{n} \end{array}
```

Using foldE:

```
\begin{array}{l} \mathsf{eval}::\mathsf{E}\to\mathsf{Int}\\ \mathsf{eval}=\mathsf{foldE}\;((+),\mathsf{negate},\mathsf{id}) \end{array}
```

Universiteit Utrecht

7.2 Variables

Universiteit Utrecht

7-6

Adding variables

```
Let us consider expressions with variables:
```

```
data E = Add E E
| Neg E
| Num Int
```

Universiteit Utrecht

Adding variables

```
Let us consider expressions with variables:
```

```
data E = Add E E
| Neg E
| Num Int
| Var Id
```

Universiteit Utrecht

Adding variables

Let us consider expressions with variables:

```
data E = Add E E
| Neg E
| Num Int
| Var Id
```

We use strings to represent identifiers:

type Id = String

Evaluating expressions with variables

What is the value of the following expression?

-x + 1

Universiteit Utrecht

Evaluating expressions with variables

What is the value of the following expression?

-x + 1

Observation

We have to know the (integer) value of x if we want to assign an (integer) value to the expression.

Universiteit Utrecht

Free variables

Similarly, in order to assign an integer value to

we have to know the integer values of x, y and z.

Universiteit Utrecht

Free variables

Similarly, in order to assign an integer value to

we have to know the integer values of x, y and z.

Variables in an expression that are not defined within the expression itself are called **free variables**.

Free variables

Similarly, in order to assign an integer value to

we have to know the integer values of x, y and z.

Variables in an expression that are not defined within the expression itself are called **free variables**.

In order to determine the value of an expression, we have to know the values of the free variables that occur in the expression.

Universiteit Utrecht

Evaluating expressions with variables

In other words, the value of an expression possibly containing free variables is not an ${\sf Int},$ but a function

 $\mathsf{Env}\to\mathsf{Int}$

where Env is an **environment** mapping the free variables to integer values.

Universiteit Utrecht

Representing an environment

We need a mapping from identifiers (type Id) to values (here type Int). There are several ways to implement such a mapping:

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

7-12

Representing an environment

We need a mapping from identifiers (type Id) to values (here type Int). There are several ways to implement such a mapping: Lists of pairs

```
type Env = [(Id, Int)]
```

Insert in O(1), lookup in O(n).

Universiteit Utrecht

Representing an environment

We need a mapping from identifiers (type Id) to values (here type Int). There are several ways to implement such a mapping: Lists of pairs

```
type Env = [(Id, Int)]
```

Insert in O(1), lookup in O(n).

Finite maps (dictionaries)

import Data.Map type Env = Map Id Int

Implemented using balanced trees. Insert/lookup in $O(\log n)$.

Universiteit Utrecht

Considerations for defining evaluation

What should the following expressions evaluate to?

let x = 1 in xlet x = y in x + xlet x = 1 in let x = 2 in xlet x = 1 in let x = x + 1 in x

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences] < ㅁ > (라 > 4 문 > 4 문 > (문 >) 로 - 의숙은

Considerations for defining evaluation

What should the following expressions evaluate to?

let x = 1 in xlet x = y in x + xlet x = 1 in let x = 2 in xlet x = 1 in let x = x + 1 in x

We observe and decide:

- in general, we still need an environment, even if we can now define closed terms with variables;
- inner definitions should shadow outer definitions;
- since we cannot make useful definitions using recursion, we do not make the bound variable available on the right hand side of the binding.

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

7.5 Using a list of declarations

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

7-28

Multiple declarations per definition

```
data E = Add E E
| Neg E
| Num Int
| Var Id
| Def [D] E -- modified
data D = Dcl Id E
```

Universiteit Utrecht

Multiple declarations per definition

```
data E = Add E E
| Neg E
| Num Int
| Var Id
| Def [D] E -- modified
data D = Dcl Id E
```

We could also have created a new datatype:

```
\begin{array}{ll} \textbf{data} \ \mathsf{E} &= \dots \\ &\mid \ \mathsf{Def} \ \mathsf{Ds} \ \mathsf{E} \\ \textbf{data} \ \mathsf{Ds} &= \mathsf{NoD} \\ &\mid \ \mathsf{OneD} \ \mathsf{Ds} \ \mathsf{D} \end{array}
```

Universiteit Utrecht

Adapting the algebra and fold

```
We keep the list in the algebra ...
```

```
type EDAlgebra e d = (\dots, [d] \rightarrow e \rightarrow e, \dots)
```

Universiteit Utrecht

Adapting the algebra and fold

```
We keep the list in the algebra ...
```

```
type EDAlgebra e d = (\dots, [d] \rightarrow e \rightarrow e, \dots)
```

... and use map in the fold function:

```
\begin{array}{l} \mathsf{foldE}::\mathsf{EDAlgebra}\;\mathsf{e}\;\mathsf{d}\to\mathsf{E}\to\mathsf{e}\\ \mathsf{foldE}\;(\mathsf{add},\mathsf{neg},\mathsf{num},\mathsf{var},\mathsf{def},\mathsf{dcl})=\mathsf{fe}\\ \textbf{where}\dots\\ \mathsf{fe}\;(\mathsf{Def}\;\mathsf{ds}\;\mathsf{e})=\mathsf{def}\;(\mathsf{map}\;\mathsf{fd}\;\mathsf{ds})\;(\mathsf{fe}\;\mathsf{e}) \end{array}
```

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

・ロト・日本・ヨト・ヨト・日 りへつ

Adapting evaluation

We now get a list of Env \rightarrow Env functions (one for each declaration) in the case for Def:

7.6 Use before definition

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

7-32

Recursion revisited

We said before that we interpret

let x = x + 1 in ...

as a redefinition because recursive functions were not useful.

Universiteit Utrecht

Recursion revisited

We said before that we interpret

```
let x = x + 1 in ...
```

as a redefinition because recursive functions were not useful.

Let us now reconsider this decision and allow

```
let { x = y + 1
   ; y = 2
   ; z = x + y + 3 }
in z
```

which will evaluate to 8.

Universiteit Utrecht

Simpler example: Let's replace all the elements of a list with the largest number

```
\begin{array}{l} \mathsf{maxAlg}:: \mathsf{ListAlgebra\ Int\ Int} \\ \mathsf{maxAlg} = \mathsf{LAlg} \ \{ \mathsf{nil} = \mathsf{minBound}, \mathsf{cons} \times \mathsf{m} = \mathsf{x}\ \mathsf{`maximum'\ m} \ \} \\ \mathsf{repAlg}:: \mathsf{Int} \to \mathsf{ListAlgebra\ Int\ [Int]} \\ \mathsf{repAlg\ m} = \mathsf{LAlg} \ \{ \mathsf{nil} = [], \mathsf{cons} \ \_ \mathsf{xs} = \mathsf{m} : \mathsf{xs} \ \} \\ \mathsf{repMax\ xs} = \mathsf{foldr\ repAlg\ (foldr\ maxAlg\ \mathsf{xs})\ \mathsf{xs}} \end{array}
```

Universiteit Utrecht

Simpler example: Let's replace all the elements of a list with the largest number

```
\begin{array}{l} \mathsf{maxAlg}:: \mathsf{ListAlgebra\ Int\ Int} \\ \mathsf{maxAlg} = \mathsf{LAlg}\ \{\mathsf{nil} = \mathsf{minBound}, \mathsf{cons} \times \mathsf{m} = \mathsf{x}\ \mathsf{`maximum'\ m}\} \\ \mathsf{repAlg}:: \mathsf{Int} \to \mathsf{ListAlgebra\ Int}\ [\mathsf{Int}] \\ \mathsf{repAlg\ m} = \mathsf{LAlg}\ \{\mathsf{nil} = [], \mathsf{cons}\ \_\,\mathsf{xs} = \mathsf{m}: \mathsf{xs}\} \\ \mathsf{repMax\ xs} = \mathsf{foldr\ repAlg}\ (\mathsf{foldr\ maxAlg\ xs})\ \mathsf{xs} \end{array}
```

```
\begin{split} \mathsf{repMaxAlg} &:: \mathsf{ListAlgebra\ Int\ }(\mathsf{Int} \to ([\mathsf{Int}],\mathsf{Int})) \\ \mathsf{repMaxAlg} &= \mathsf{LAlg\ }\{\mathsf{nil} \qquad = \lambda\mathsf{max} \to ([],\mathsf{minBound}) \\ ,\ \mathsf{cons\ x\ }f &= \lambda\mathsf{max} \to \\ \mathsf{let\ }(\mathsf{ys},\mathsf{maxSoFar}) &= f\ \mathsf{max} \\ \mathsf{in\ }(\mathsf{max}:\mathsf{ys},\mathsf{x\ }\mathsf{`maximum'\ maxSoFar}) \} \end{split}
```

Universiteit Utrecht

[Faculty of Science Information and Computing Sciences]

・ロト・日本・日本・日本・日本・日本

```
\label{eq:constraint} \begin{array}{l} \mathsf{repMaxAlg} :: \mathsf{ListAlgebra} \ \mathsf{Int} \ (\mathsf{Int} \to ([\mathsf{Int}],\mathsf{Int})) \\ \mathsf{repMaxAlg} = \mathsf{LAlg} \ \{\mathsf{nil} &= \lambda\mathsf{max} \to ([],\mathsf{minBound}) \\ , \mathsf{cons} \ \mathsf{x} \ \mathsf{f} = \lambda\mathsf{max} \to \\ & \mathsf{let} \ (\mathsf{ys},\mathsf{maxSoFar}) = \mathsf{f} \ \mathsf{max} \\ & \mathsf{in} \ (\mathsf{max}:\mathsf{ys},\mathsf{x} \ \mathsf{'maximum'} \ \mathsf{maxSoFar}) \} \\ \mathsf{repMax} :: [\mathsf{Int}] \to [\mathsf{Int}] \\ \mathsf{repMax} \ \mathsf{xs} = \mathsf{maxs} \\ & \mathsf{where} \ (\mathsf{maxs},\mathsf{max}) = \mathsf{foldr} \ \mathsf{repMaxAlg} \ \mathsf{xs} \ \mathsf{max} \end{array}
```

[Faculty of Science Information and Computing Sciences]

・ロト・日本・日本・日本・日本・日本

```
\begin{split} & \mathsf{repMaxAlg} :: \mathsf{ListAlgebra} \ \mathsf{Int} \ (\mathsf{Int} \to ([\mathsf{Int}],\mathsf{Int})) \\ & \mathsf{repMaxAlg} = \mathsf{LAlg} \ \{\mathsf{nil} = \lambda\mathsf{max} \to ([],\mathsf{minBound}) \\ & ,\mathsf{cons} \ \mathsf{x} \ \mathsf{f} = \lambda\mathsf{max} \to \\ & \mathsf{let} \ (\mathsf{ys},\mathsf{maxSoFar}) = \mathsf{f} \ \mathsf{max} \\ & \mathsf{in} \ (\mathsf{max}:\mathsf{ys},\mathsf{x} \ \mathsf{'maximum'} \ \mathsf{maxSoFar}) \} \\ & \mathsf{repMax} :: [\mathsf{Int}] \to [\mathsf{Int}] \\ & \mathsf{repMax} \ \mathsf{xs} = \mathsf{maxs} \\ & \mathsf{where} \ (\mathsf{maxs},\mathsf{max}) = \mathsf{foldr} \ \mathsf{repMaxAlg} \ \mathsf{xs} \ \mathsf{max} \end{split}
```

What does 'foldr repMaxAlg xs undefined' return?

Universiteit Utrecht

Evaluating recursive declarations

The result type for declarations now becomes

```
\mathsf{Env} 	o \mathsf{Env} 	o \mathsf{Env}
```

We pass **two** environments:

the current environment about to be extended,

the final environment that already is extended (boldly assuming that we already know that).

Evaluating recursive declarations

The result type for declarations now becomes

```
\mathsf{Env}\to\mathsf{Env}\to\mathsf{Env}
```

We pass two environments:

the current environment about to be extended,

the final environment that already is extended (boldly assuming that we already know that).

We use the final environment to evaluate the right hand sides.

We extend the current environment one by one.

Universiteit Utrecht

Evaluating recursive declarations

The result type for declarations now becomes

```
\mathsf{Env} 
ightarrow \mathsf{Env} 
ightarrow \mathsf{Env}
```

We pass two environments:

the current environment about to be extended,

the final environment that already is extended (boldly assuming that we already know that).

We use the final environment to evaluate the right hand sides.

We extend the current environment one by one.

In the end, we tie the knot as follows:

let finalenv = process ds currentenv finalenv in . . .

Summary

- We can define algebras and folds also for families of mutually recursive types, and also if lists (or other types) occur surrounding the recursive positions.
- Often, the result types of algebras are themselves functions.
- Function arguments represent information that is distributed over the abstract syntax tree.
- Function results represent information that is computed from the abstract syntax tree (and the distributed values).
- Next lecture: regular languages.
