Jacco Bikker & Debabrata Panja - April-July 2017

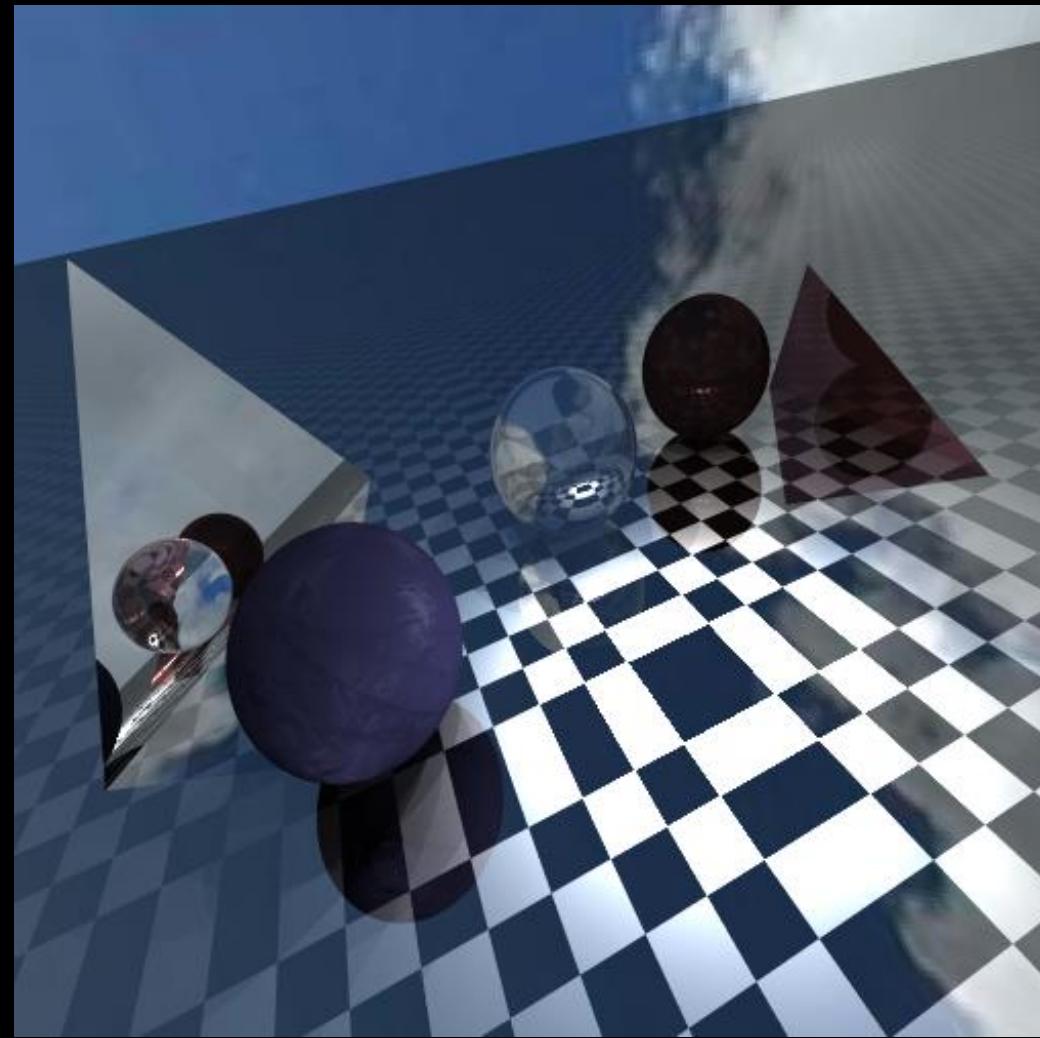

Lecture 10: “Shaders”

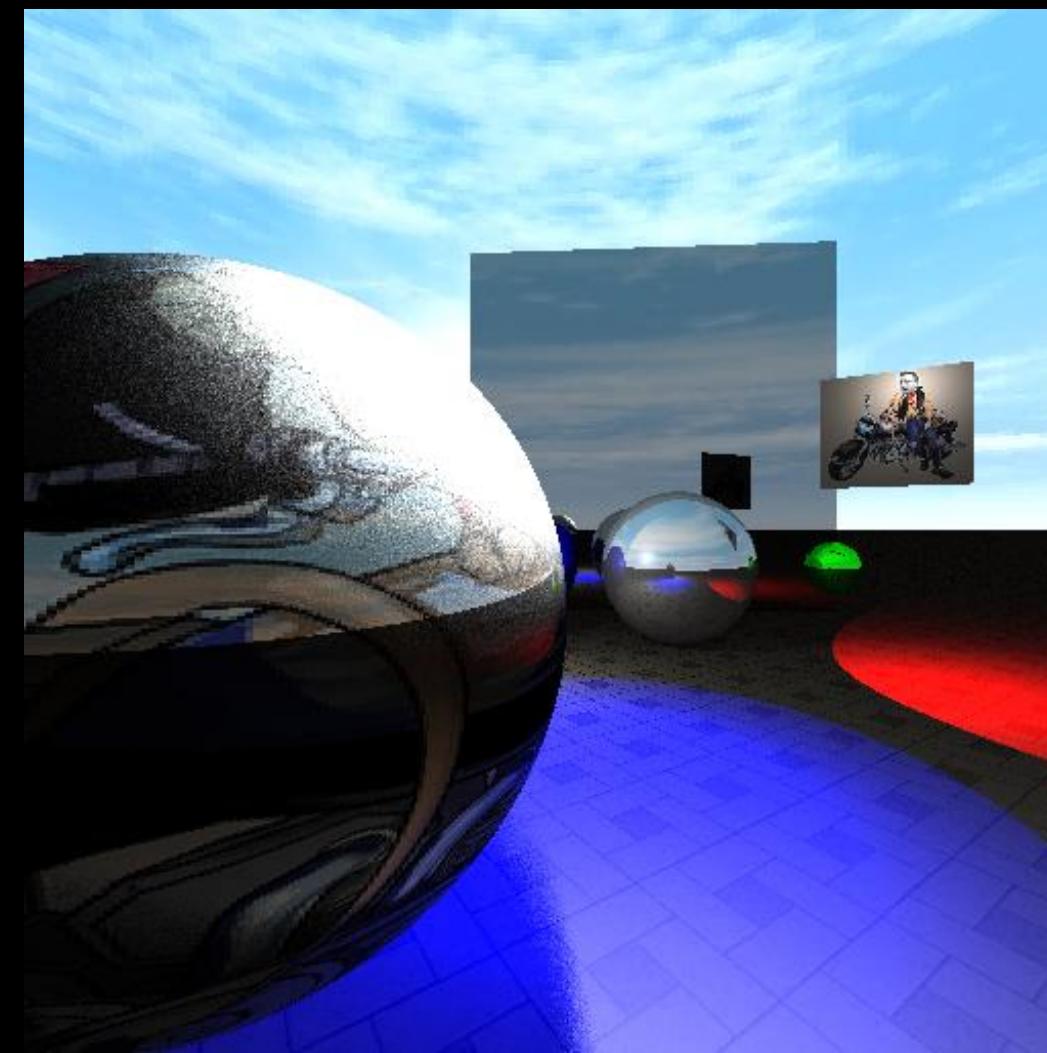

Welcome!

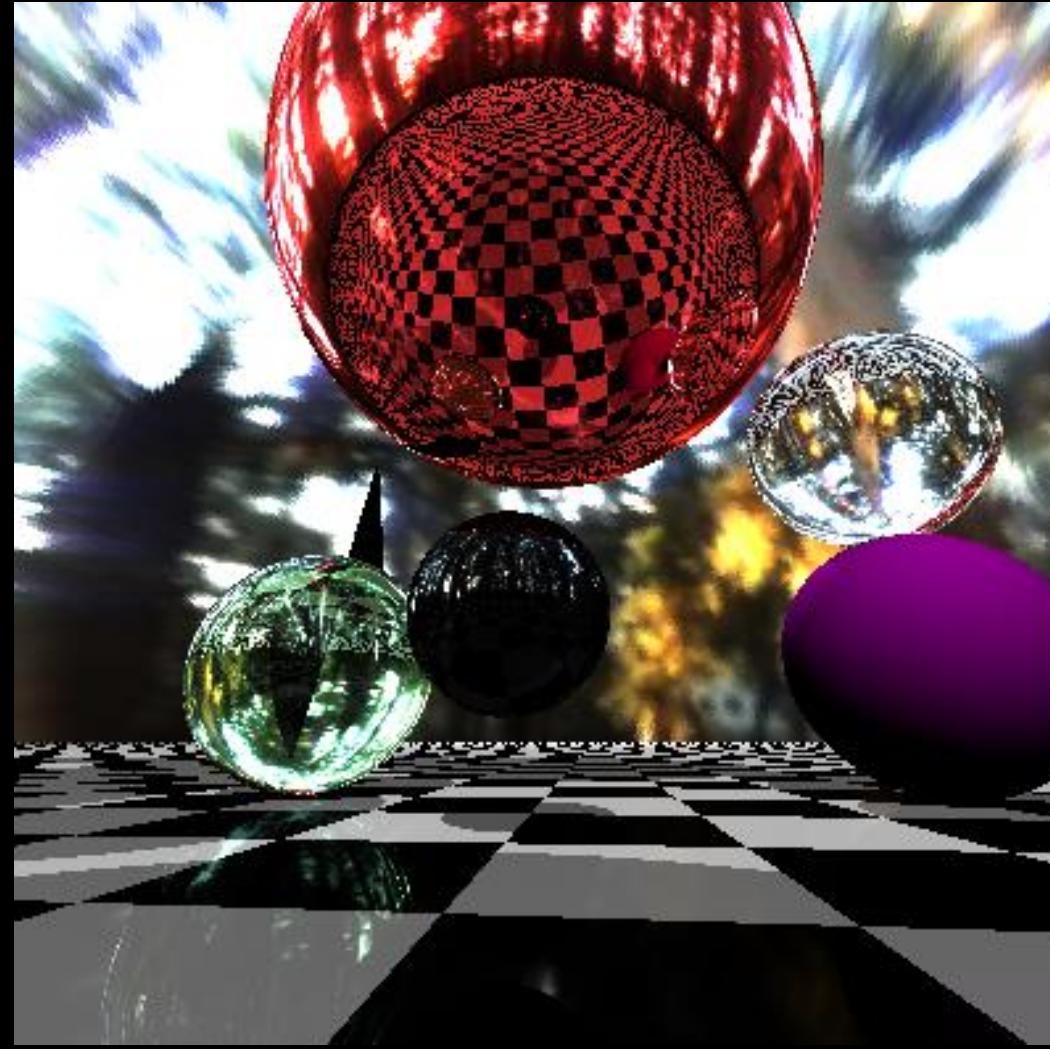

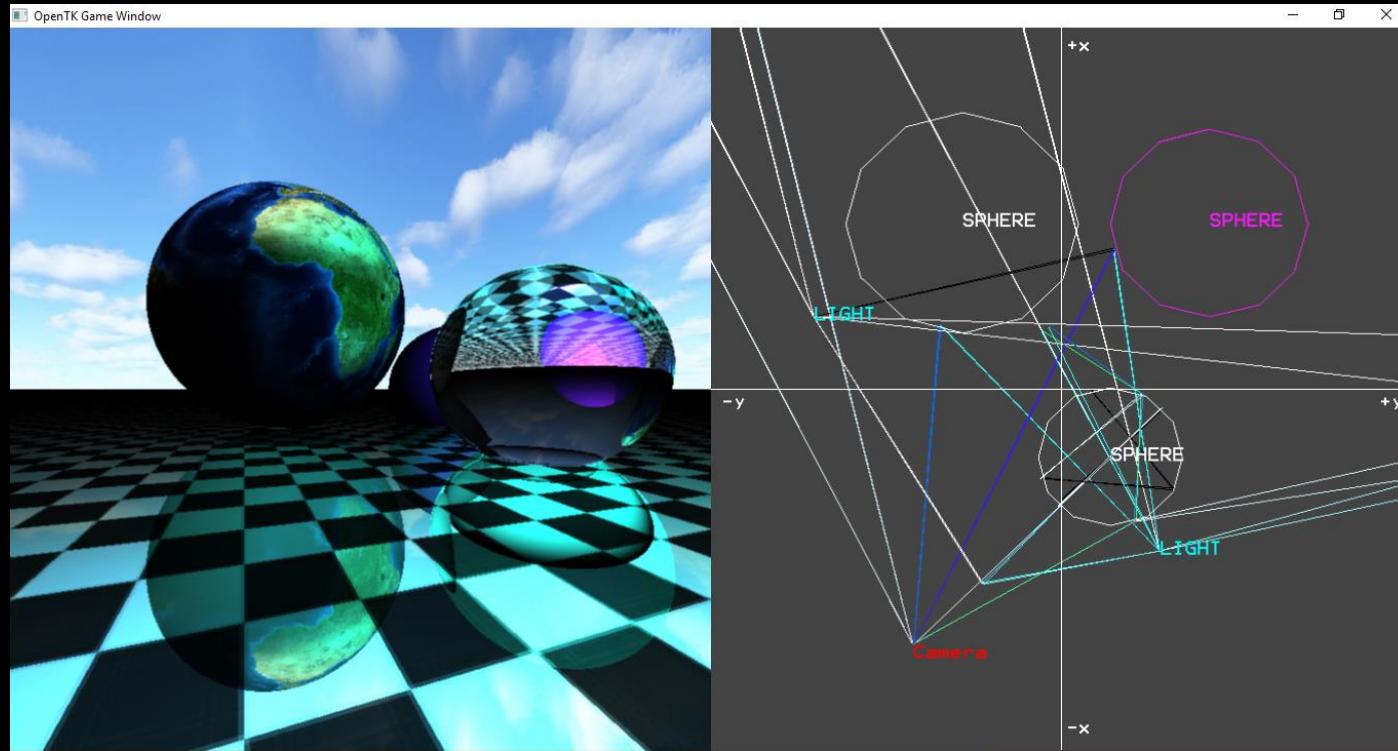

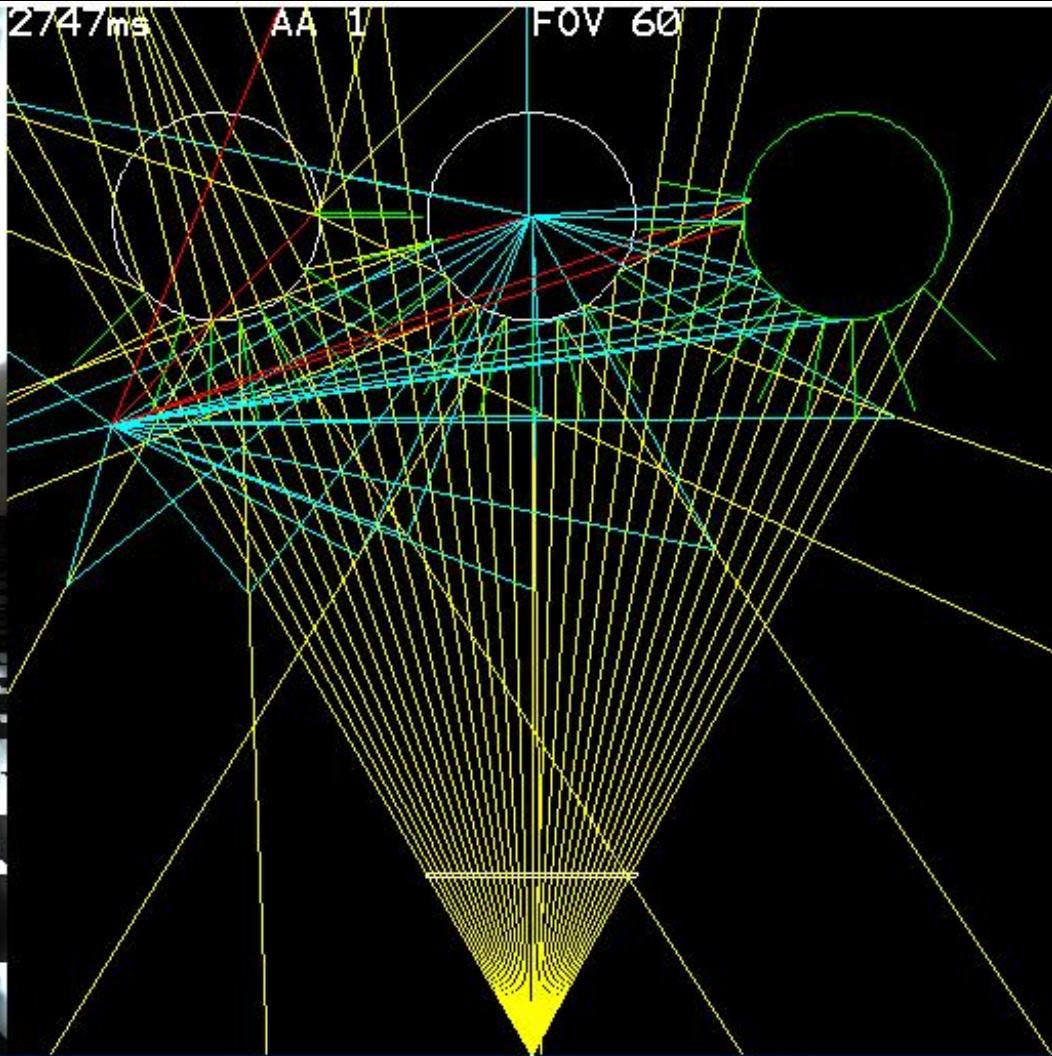

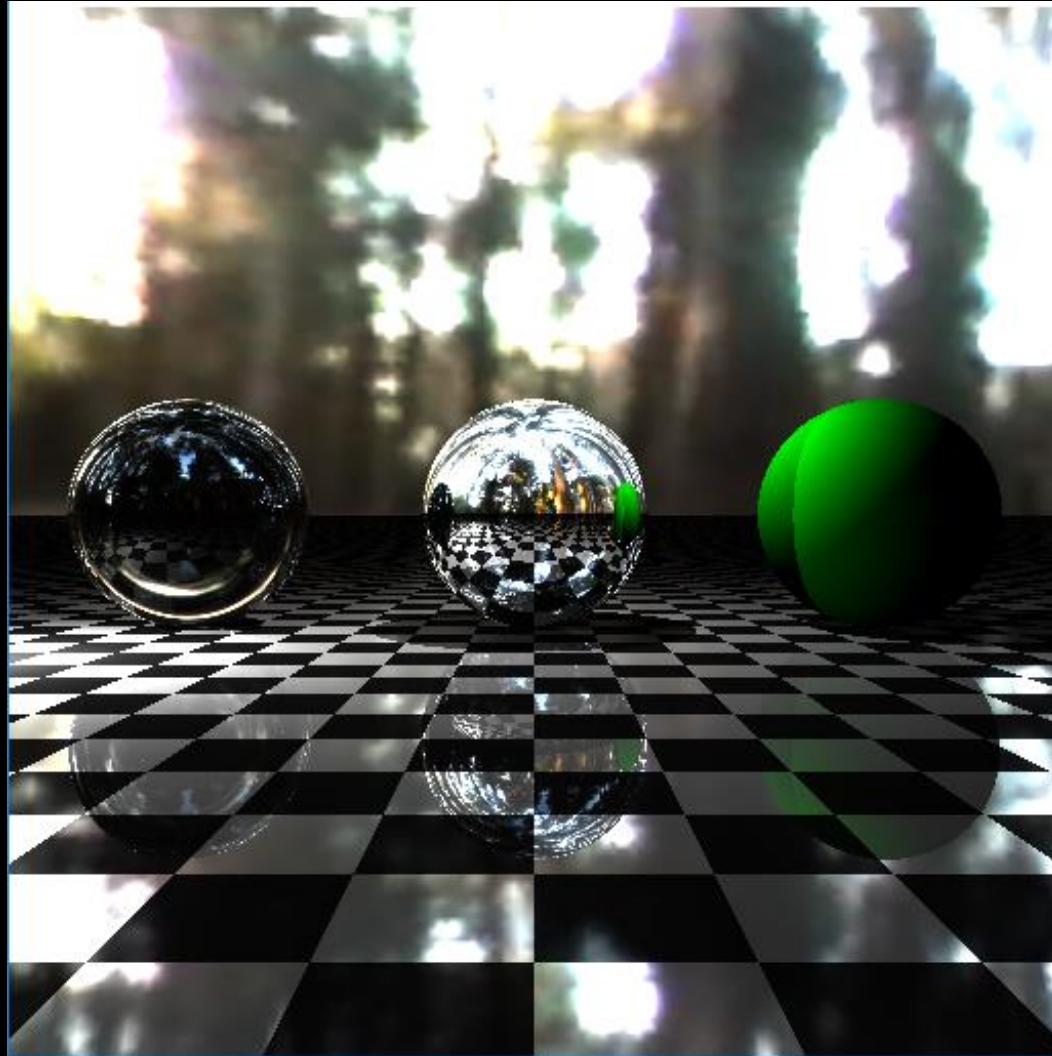

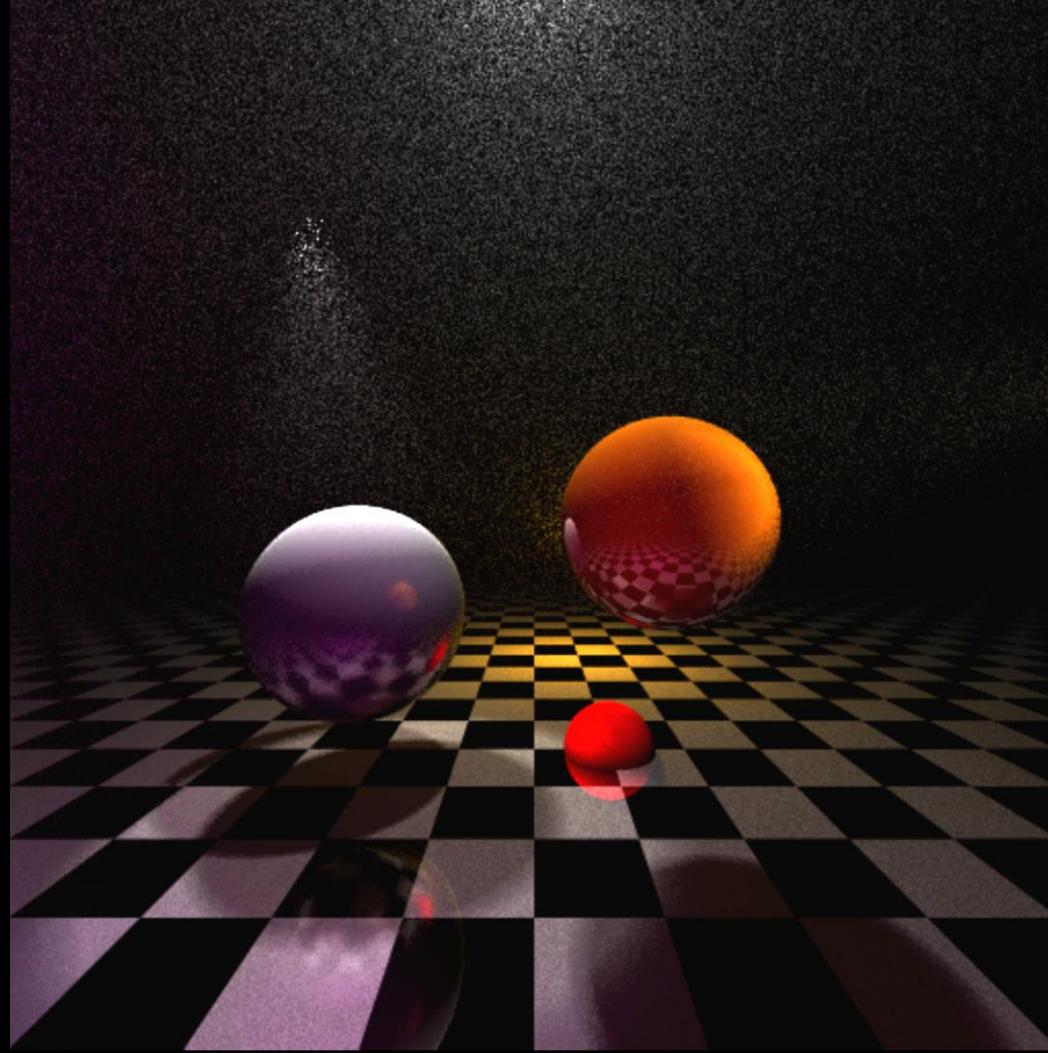

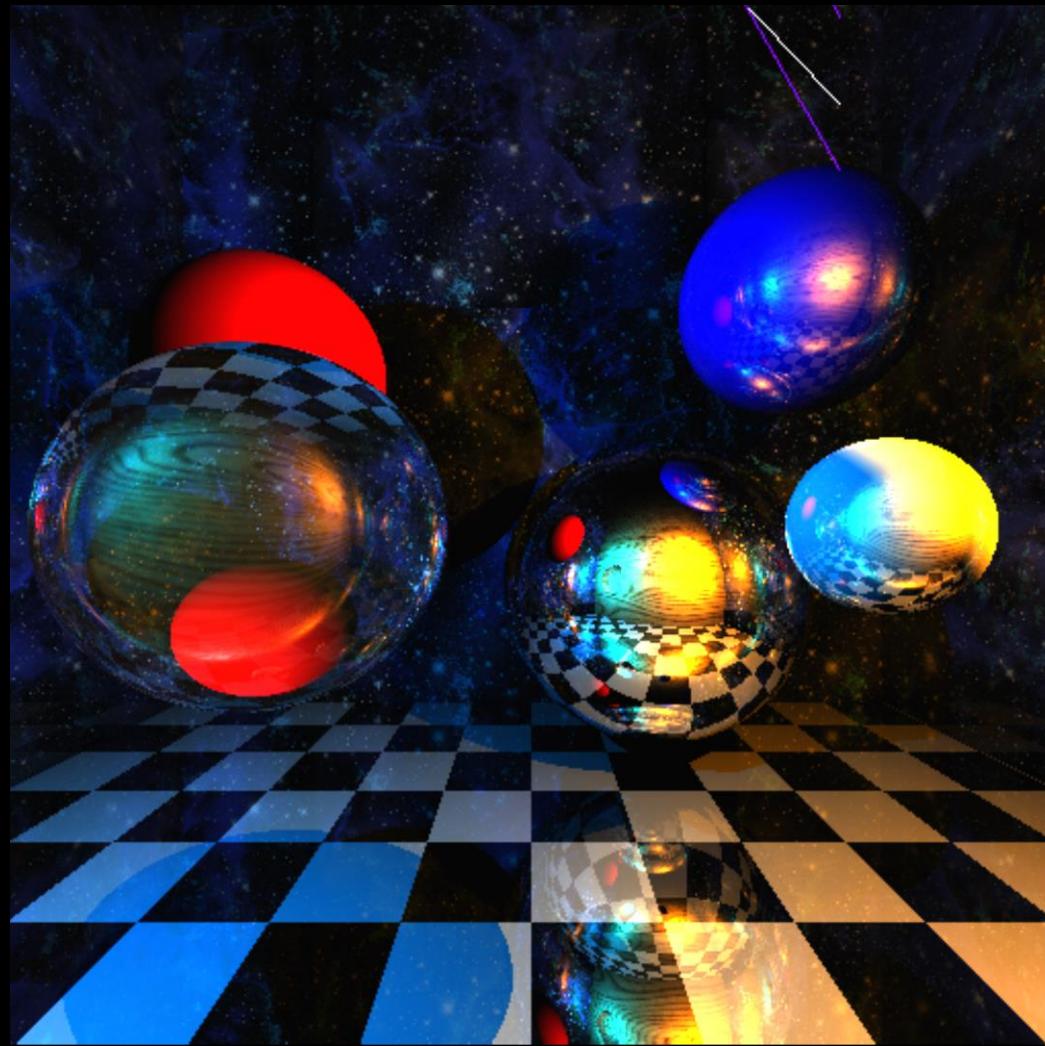

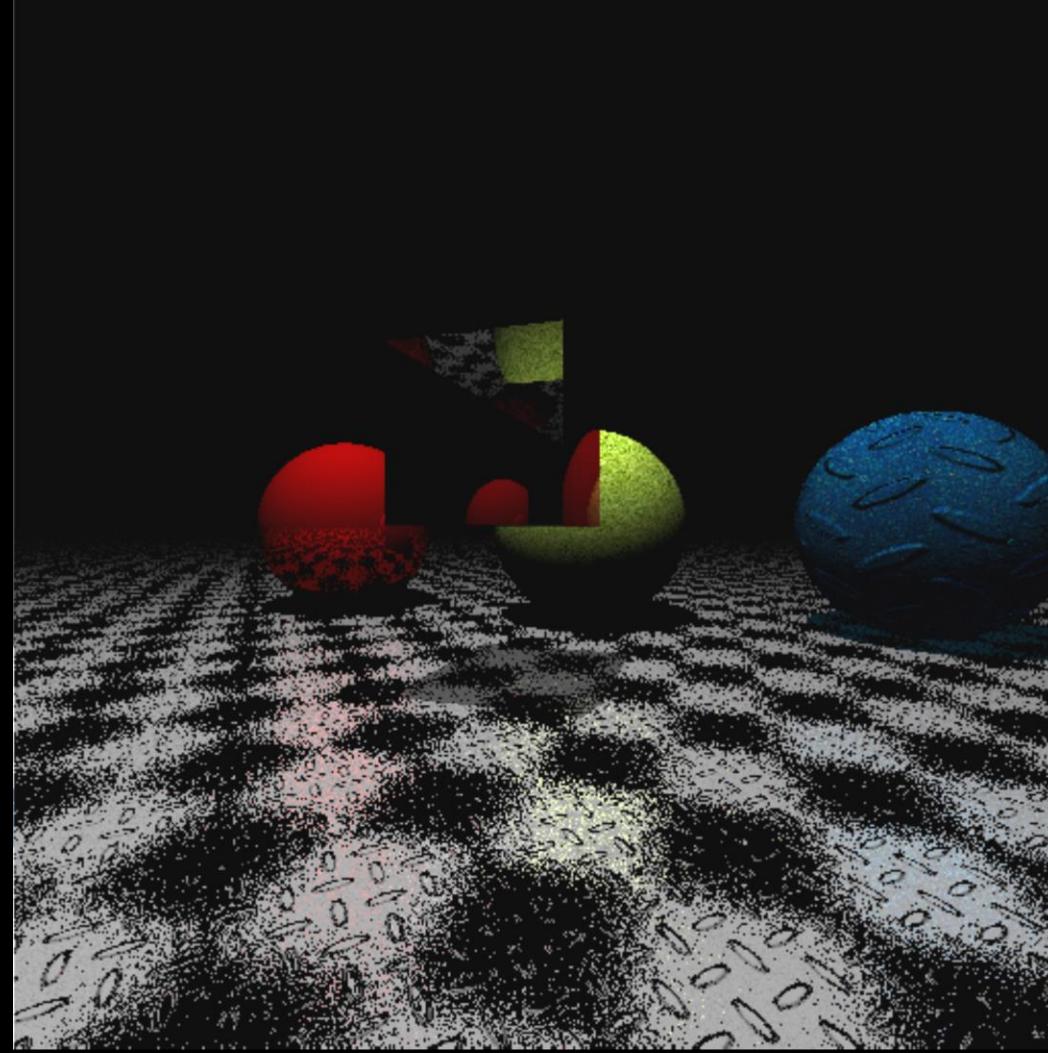

INFOGR2016/17

Today's Agenda:

- Recap: Diffuse Materials
- The Phong Shading Model
- Environment Mapping
- Normal Mapping
- Rendering Short Fur

Diffuse

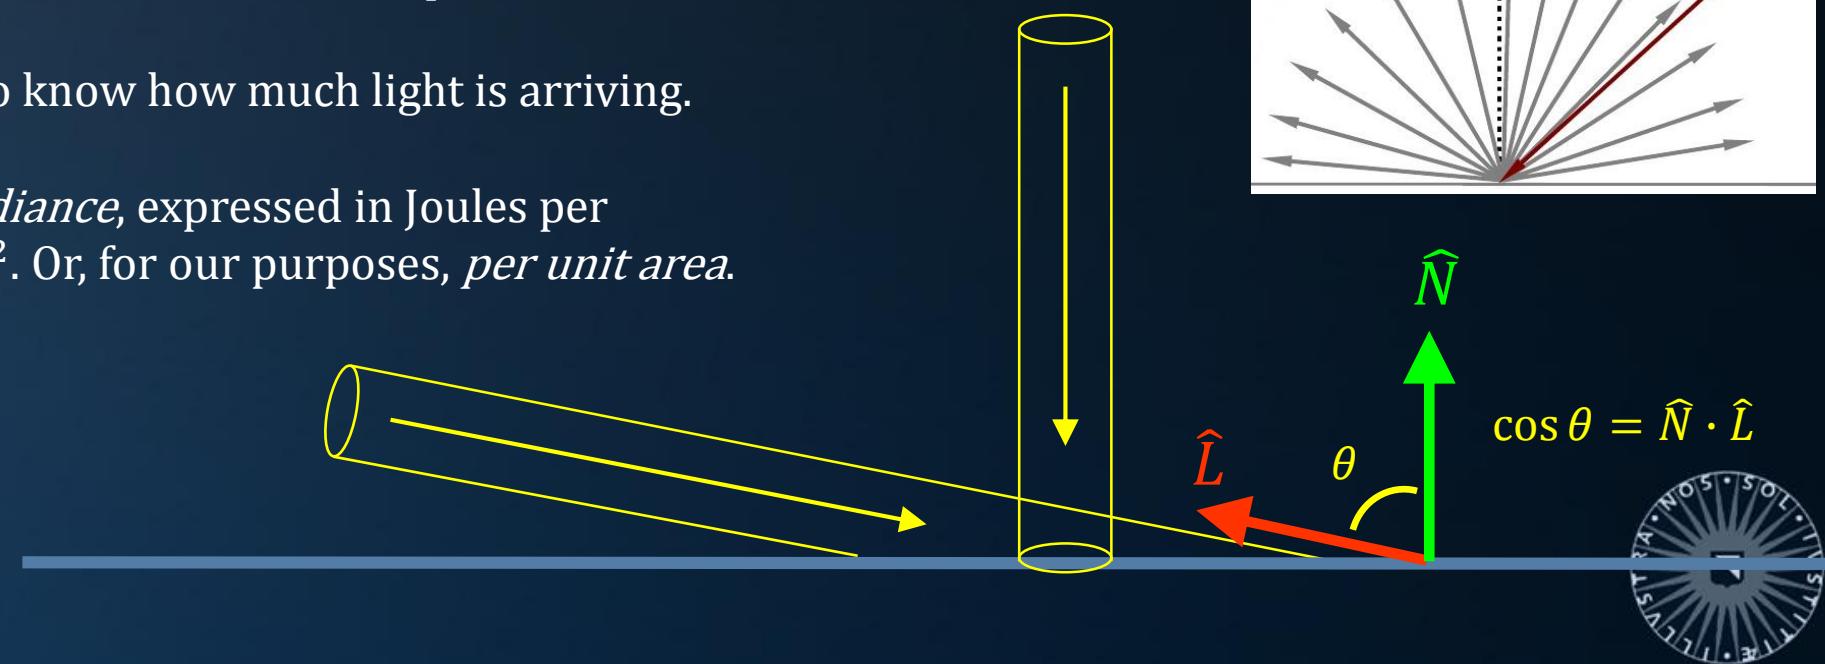

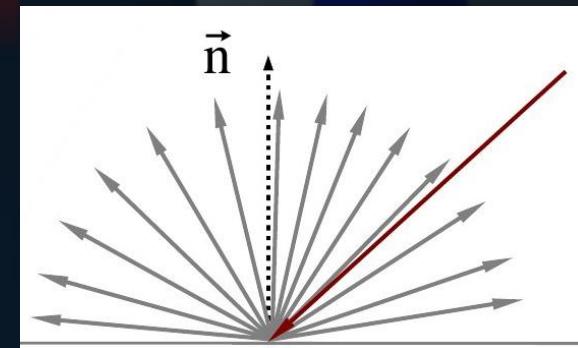

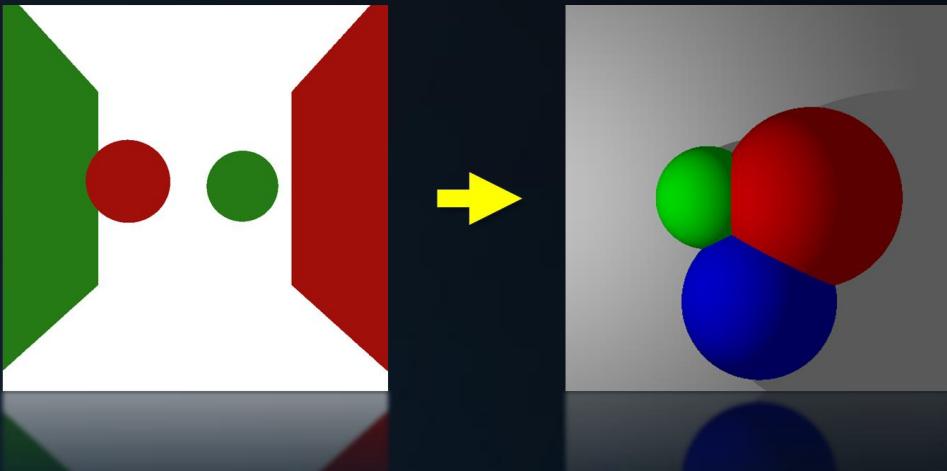

Basics of Shading

A diffuse material scatters incoming light equally in all directions.

Two aspects to this:

1. Diffuse materials are view-independent.
2. We need to know how much light is arriving.

Arriving: *irradiance*, expressed in Joules per second per m^2 . Or, for our purposes, *per unit area*.

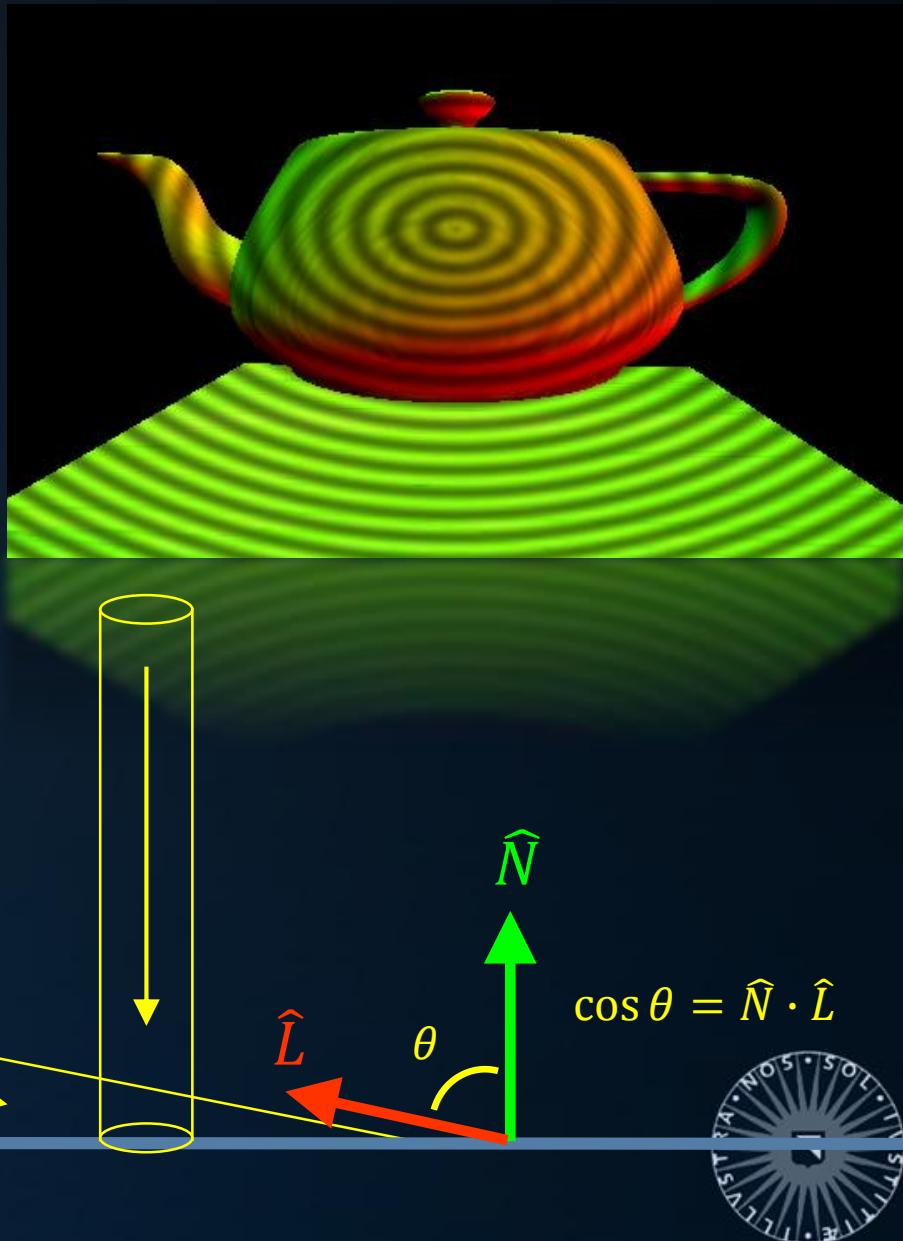

Diffuse

Basics of Shading

So, in the fragment shader:

- Calculate L : $L = lightPos - intersectionPoint$
- Use N : already passed via vertex shader
- Apply attenuation, scale by material color
- Multiply by light color
- Emit fragment color.

But wait...

```

    <!-- (depth < MAXDEPTH)
    <-- inside / nt
    <-- nt / nc, ddc
    <-- pos2t = 1.0f - nt
    <-- D * N;
    <--)
    <-- a = nt * nc, b = nt
    <-- Tr = 1.0f - (R0 + (1.0f - R0) * Tr);
    <-- R = (D * nnt - N) / (D * nnt + N);
    <-- E * diffuse;
    <-- = true;
    <-- refl + refr)) && (depth < MAXDEPTH)
    <-- N );
    <-- refl * E * diffuse;
    <-- = true;
MAXDEPTH)

survive = SurvivalProbability( diffuse,
estimation - doing it properly, class
if;
radiance = SampleLight( &rand, I, &L, &light,
e.x + radiance.y + radiance.z) > 0) && (rand <
v = true;
at brdfPdf = EvaluateDiffuse( L, N ) * Psurvive;
at3 factor = diffuse * INVPi;
at weight = Mis2( directPdf, brdfPdf );
at cosThetaOut = dot( N, L );
E * ((weight * cosThetaOut) / directPdf) * (radiance
random walk - done properly, closely following
alive)
;

at3 brdf = SampleDiffuse( diffuse, N, r1, r2, &R, &spot
survive;
pdf;
n = E * brdf * (dot( N, R ) / pdf);
ision = true;

```

Diffuse

Basics of Shading

So, in the fragment shader:

- Calculate L : $L = \text{lightPos} - \text{intersectionPoint}$
- Use N : already passed via vertex shader
- Apply attenuation, scale by material color
- Multiply by light color
- Emit fragment color.

But wait...

We have significant problems:

1. How do we specify a light position
2. In *which space* do we operate?

Ehm...

That one?

```
#version 330
// shader input
in vec2 vUV;
in vec3 vNormal;
in vec3 vPosition;

// shader output
out vec4 normal;
out vec2 uv;
uniform mat4 transform;

// vertex shader
void main()
{
    // transform vertex using supplied matrix
    gl_Position = transform * vec4( vPosition, 1.0 );

    // forward normal and uv coordinate
    normal = transform * vec4( vNormal, 0.0f );
    uv = vUV;
}
```

model space

model space
to
screen space

Diffuse

Spaces

Default matrix in game.cs:

```
Matrix4 transform = Matrix4.CreateFromAxisAngle( new Vector3( 0, 1, 0 ), a );
transform *= Matrix4.CreateTranslation( 0, -4, -15 );
transform *= Matrix4.CreatePerspectiveFieldOfView( 1.2f, 1.3f, .1f, 1000 );
```

This produces:

- a teapot that spins around it's pivot
- a camera located at (0, 4, 15) *or* the teapot spins at (0, -4, 15), camera is at (0, 0, 0).

The last line adds perspective.

→ We need a '*base system*' in which we can define a light position: *world space*.

Diffuse

Spaces

Getting model space coordinates to world space:

```
Matrix4 transform = Matrix4.CreateFromAxisAngle( new Vector3( 0, 1, 0 ), a );
Matrix4 toWorld = transform;
transform *= Matrix4.CreateTranslation( 0, -4, -15 );
transform *= Matrix4.CreatePerspectiveFieldOfView( 1.2f, 1.3f, .1f, 1000 );
```

We need some additional changes now:

```
public void Render(
    Shader shader,
    Matrix4 transform,
    Matrix4 toWorld,
    Texture texture
```

...

Diffuse

Changes

The vertex shader now takes two matrices:

```
// transforms
uniform mat4 transform;      // full transform: model space to screen space
uniform mat4 toWorld;        // model space to world space
```

...and uses them:

```
gl_Position = transform * vec4( vPosition, 1.0 );
worldPos = toWorld * vec4( vPosition, 1.0f );
normal = toWorld * vec4( vNormal, 0.0f );
```

Diffuse

Changes

The shader class needs to know about the two matrices:

```
public int uniform_mview;
public int uniform_2wrld;

...
uniform_mview = GL.GetUniformLocation( programID, "transform" );
uniform_2wrld = GL.GetUniformLocation( programID, "toWorld" );
```

And the mesh class needs to pass both to the shader:

```
// pass transforms to vertex shader
GL.UniformMatrix4( shader.uniform_mview, false, ref transform );
GL.UniformMatrix4( shader.uniform_2wrld, false, ref toWorld );
```

Diffuse

Changes

The new fragment shader, complete:

```
#version 330

in vec2 uv;           // interpolated texture coordinates
in vec4 normal;       // interpolated normal, world space
in vec4 worldPos;    // world space position of fragment
uniform sampler2D pixels; // texture sampler
out vec4 outputColor; // shader output
uniform vec3 lightPos; // light position in world space
void main()           // fragment shader
{
    vec3 L = lightPos - worldPos.xyz;
    float dist = L.length();
    L = normalize( L );
    vec3 lightColor = vec3( 10, 10, 8 );
    vec3 materialColor = texture( pixels, uv ).xyz;
    float attenuation = 1.0f / (dist * dist);
    outputColor = vec4( materialColor * max( 0.0f, dot( L, normal.xyz ) ) *
        attenuation * lightColor, 1 );
}
```

In game.cs, Init():

```
// set the light
int lightID = GL.GetUniformLocation(
    shader.programID,
    "lightPos"
);
GL.UseProgram( shader.programID );
GL.Uniform3(
    lightID,
    0.0f, 10.0f, 0.0f
);
```

Diffuse

```
    < / (depth < MAXDEPTH)
    c = inside / t;
    nt = nt / nc, ddc;
    os2t = 1.0f - osnt;
    D, N );
}

```

Today's Agenda:

- Recap: Diffuse Materials
- The Phong Shading Model
- Environment Mapping
- Normal Mapping
- Rendering Short Fur

Phong

Glossy Materials

A glossy material reflects, but the reflection is somewhat fuzzy:

```

    <depth > MAXDEPTH
    if( t < depth )
        n = inside / t;
        nt = nt / nc, dnt = dnt / nc;
        cos2t = 1.0f - nt * nt;
        D = D * nnt - N * N;
    }

    at a = nt + nc, b = nt
    at Tr = 1 - (R0 + (1 - R0) * Tr) R = (D * nnt - N * N) / (a * b);
    E * diffuse;
    = true;

    if( refl + refr ) && (depth < MAXDEPTH)
        if( dot( N, L ) > 0 )
            if( dot( N, R ) > 0 )
                if( dot( N, R ) > 0 )
                    if( dot( N, R ) > 0 )
                        if( dot( N, R ) > 0 )
                            if( dot( N, R ) > 0 )
                                if( dot( N, R ) > 0 )
                                    if( dot( N, R ) > 0 )
                                        if( dot( N, R ) > 0 )
                                            if( dot( N, R ) > 0 )
                                                if( dot( N, R ) > 0 )
                                                    if( dot( N, R ) > 0 )
                                                        if( dot( N, R ) > 0 )
                                                            if( dot( N, R ) > 0 )
                                                                if( dot( N, R ) > 0 )
                                                                    if( dot( N, R ) > 0 )
                                                                        if( dot( N, R ) > 0 )
                                                                            if( dot( N, R ) > 0 )
                                                                                if( dot( N, R ) > 0 )
                                                                                    if( dot( N, R ) > 0 )
                                                                                        if( dot( N, R ) > 0 )
                                                                                            if( dot( N, R ) > 0 )
                                                                                                if( dot( N, R ) > 0 )
                                                                
MAXDEPTH)

survive = SurvivalProbability( diffuse );
estimation - doing it properly, classically;

```

Phong

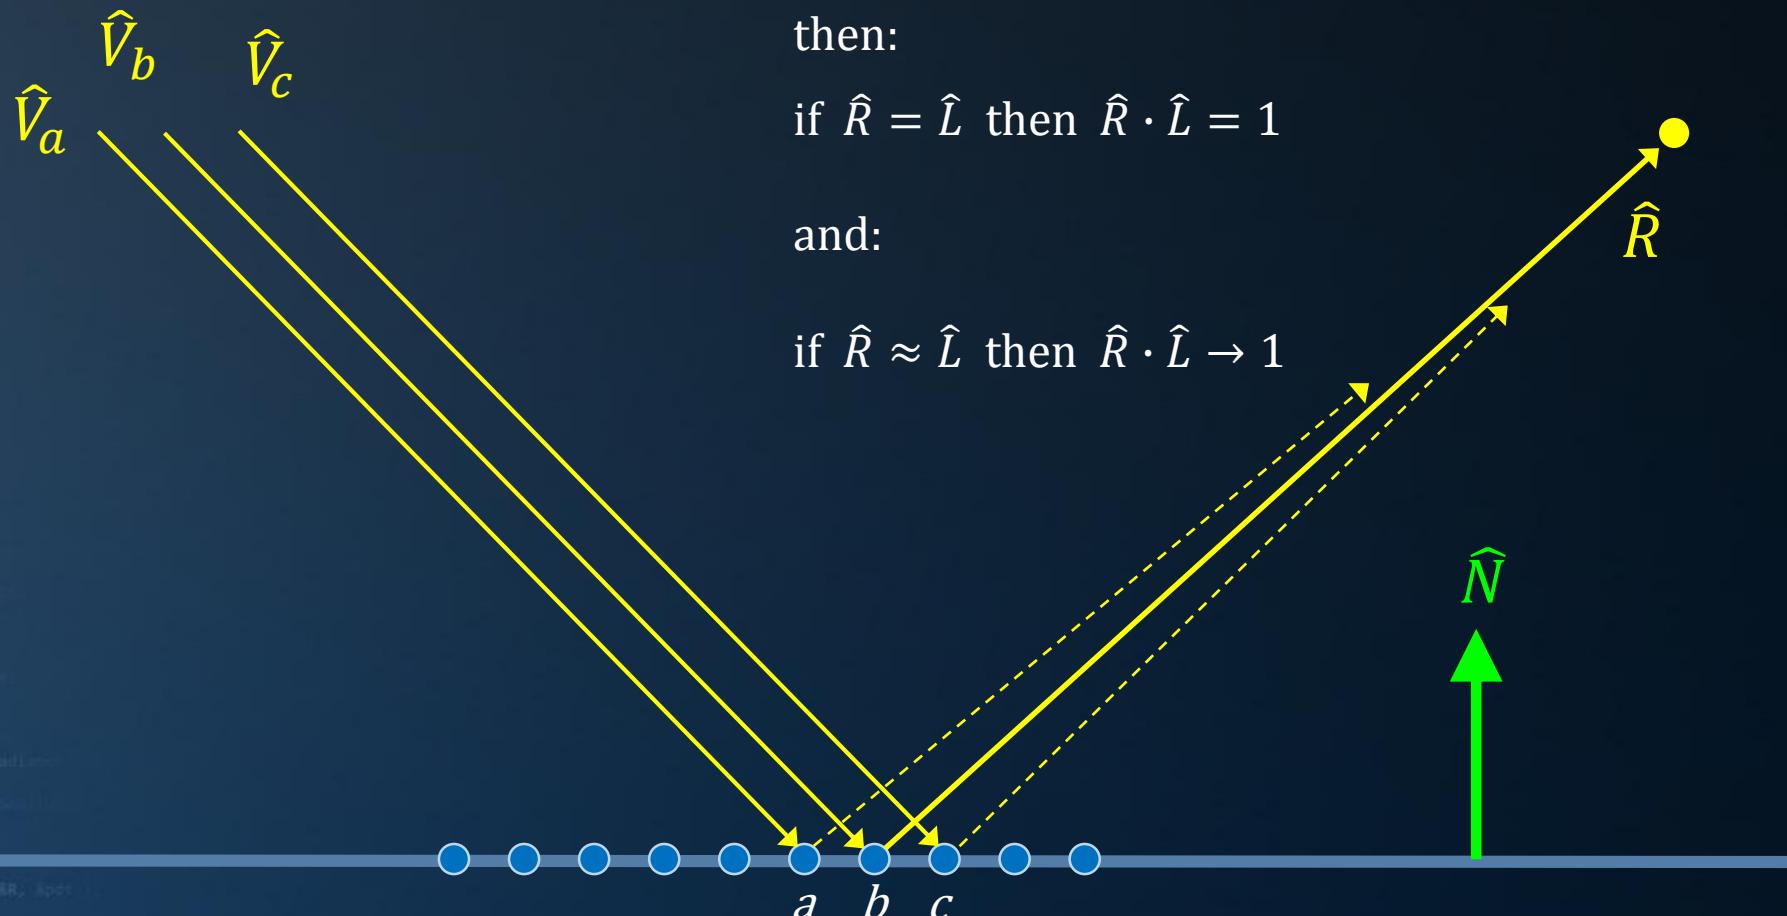

Glossy Materials

Let:

\hat{L} be a vector from the fragment position b to the light;

\hat{R} be the vector \hat{V}_b reflected in the plane with normal \hat{N}

then:

if $\hat{R} = \hat{L}$ then $\hat{R} \cdot \hat{L} = 1$

and:

if $\hat{R} \approx \hat{L}$ then $\hat{R} \cdot \hat{L} \rightarrow 1$

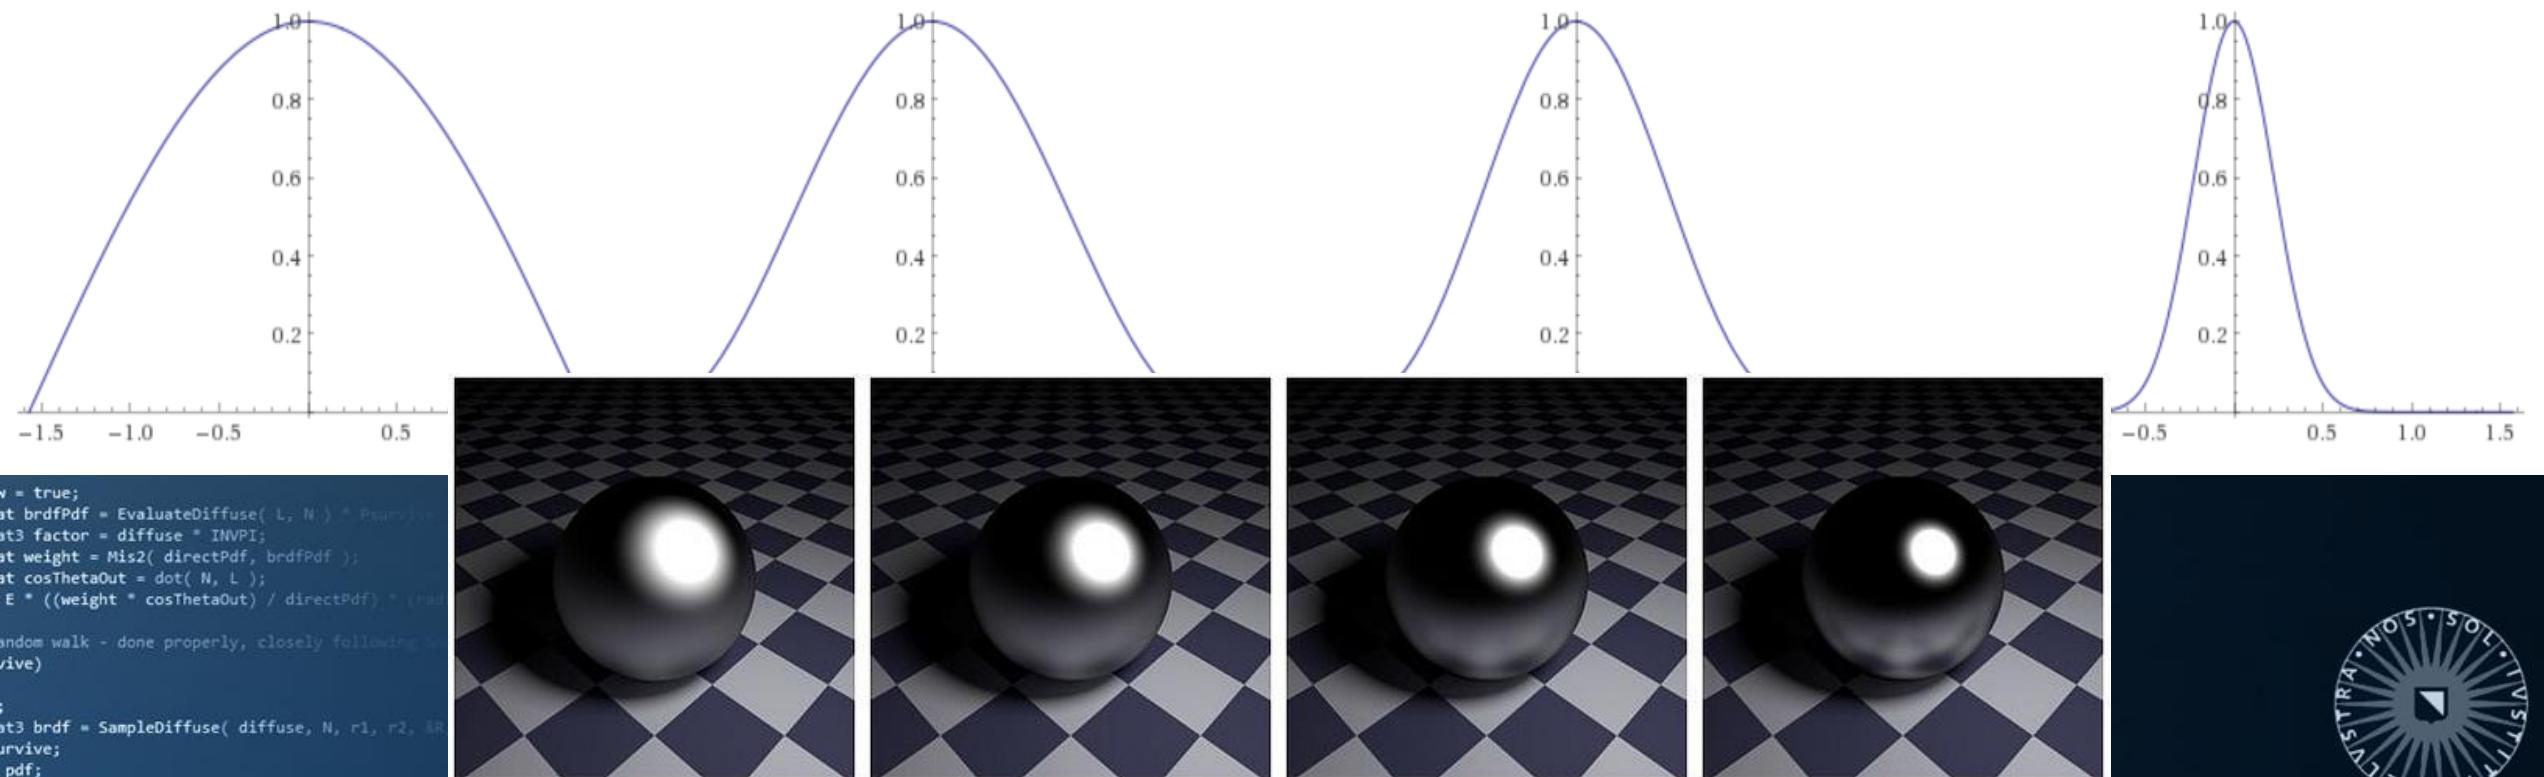

Phong

Glossy Materials

"Locations near b receive almost as much light as b."

But how much? $(\hat{L} \cdot \hat{V})^\alpha$

Phong

The Full Phong

$$M_{phong} = c_{ambient} + c_{diff}(\vec{N} \cdot \vec{L})L_{diff} + c_{spec}(\vec{L} \cdot \vec{R})^\alpha L_{spec}$$

The Phong material model is a combination of:

- ‘Specular’ illumination: $(\vec{L} \cdot \vec{R})^\alpha$, times the ‘specular color’ of the light, times the ‘specular color’ of the material;
- Diffuse illumination: $(\vec{N} \cdot \vec{L})$, times the ‘diffuse color’ of the light, times the ‘diffuse color’ of the material;
- An ‘ambient color’.

Phong

Mirrors

Environment Mapping

Reflections on complex surfaces are faked using an environment map.

This is done exactly as in a ray tracer:

- at the fragment position, we have \hat{V} and \hat{N} ;
- based on these we calculate the reflected vector \hat{R} ;
- we use \hat{R} to look up a value in the skydome texture.

Limitations:

- we will not reflect anything but the skydome;
- the reflection is static.

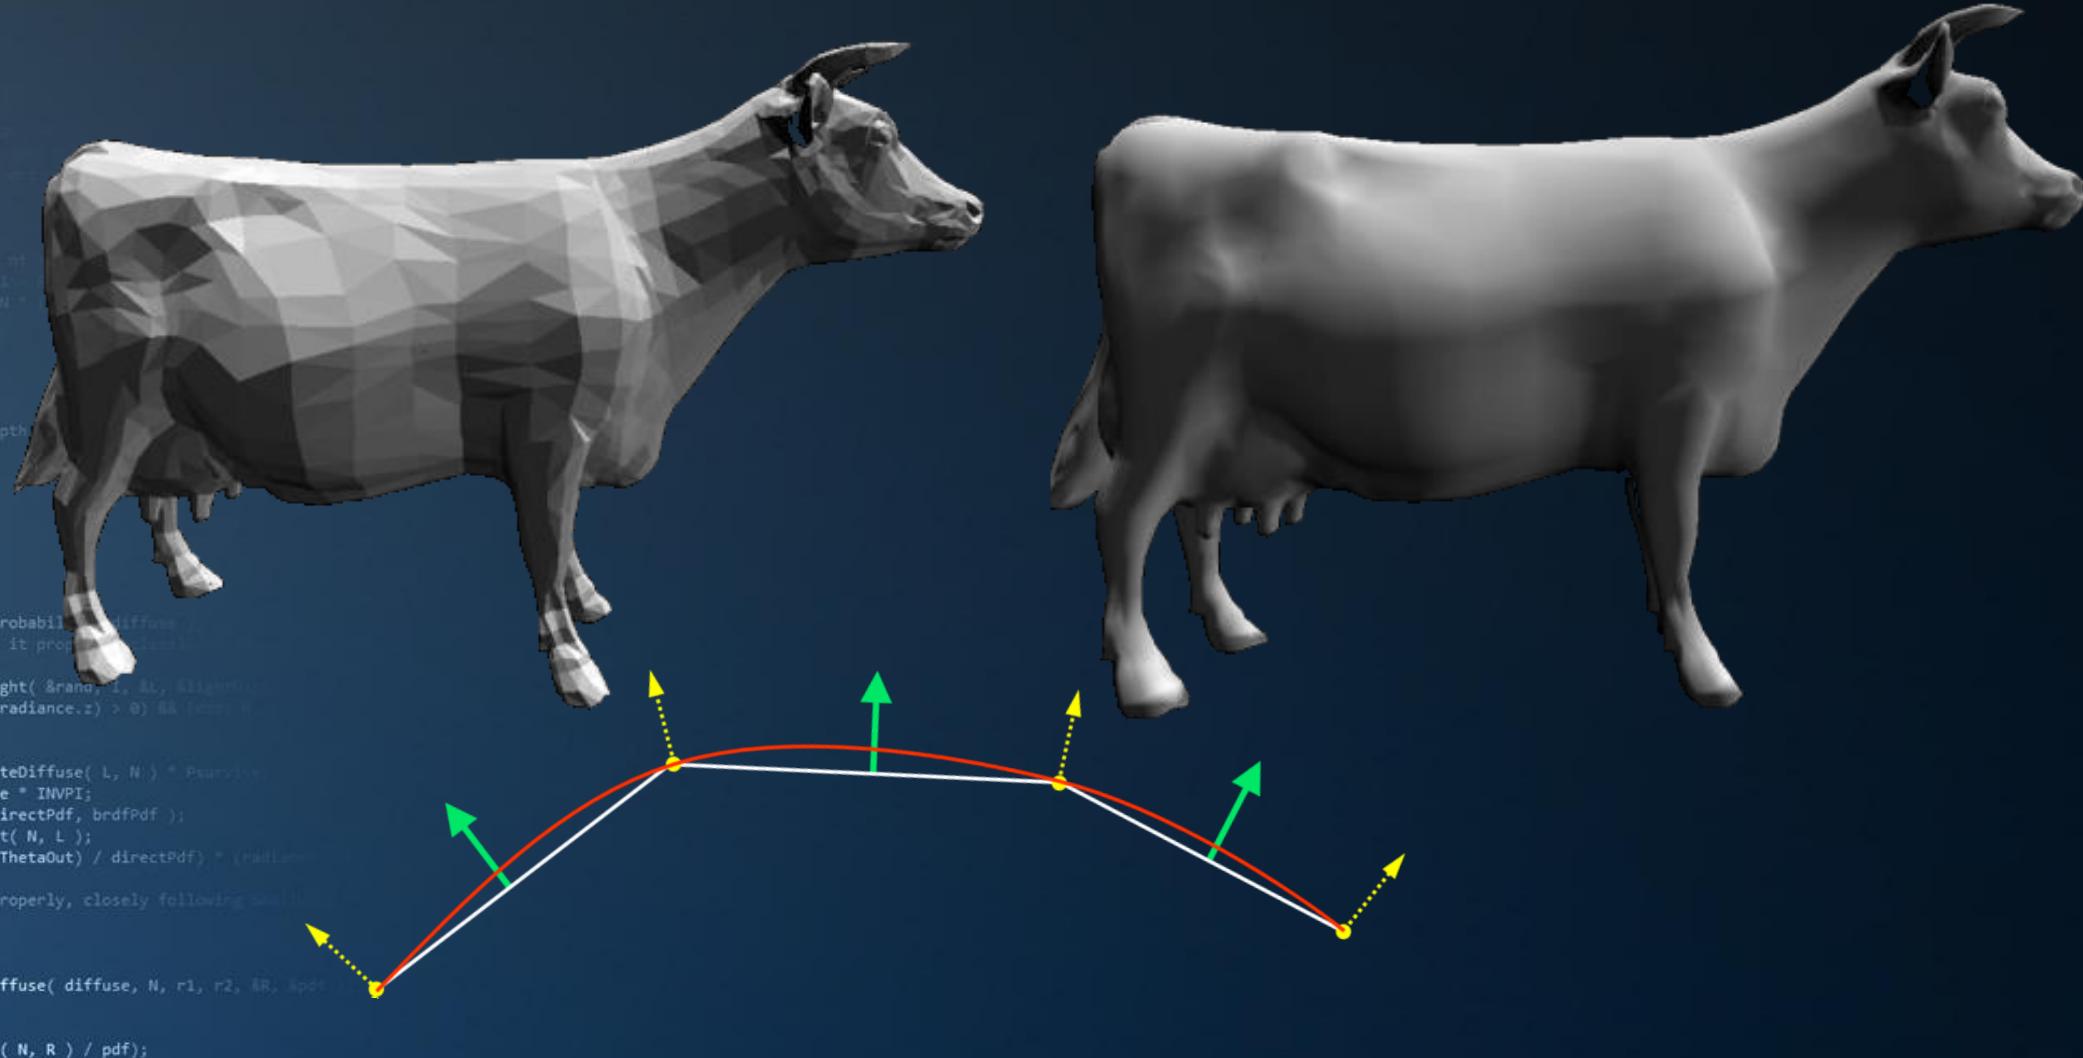

Today's Agenda:

- Recap: Diffuse Materials
- The Phong Shading Model
- Environment Mapping
- Normal Mapping
- Rendering Short Fur

Bumps

Recap: Normal Interpolation

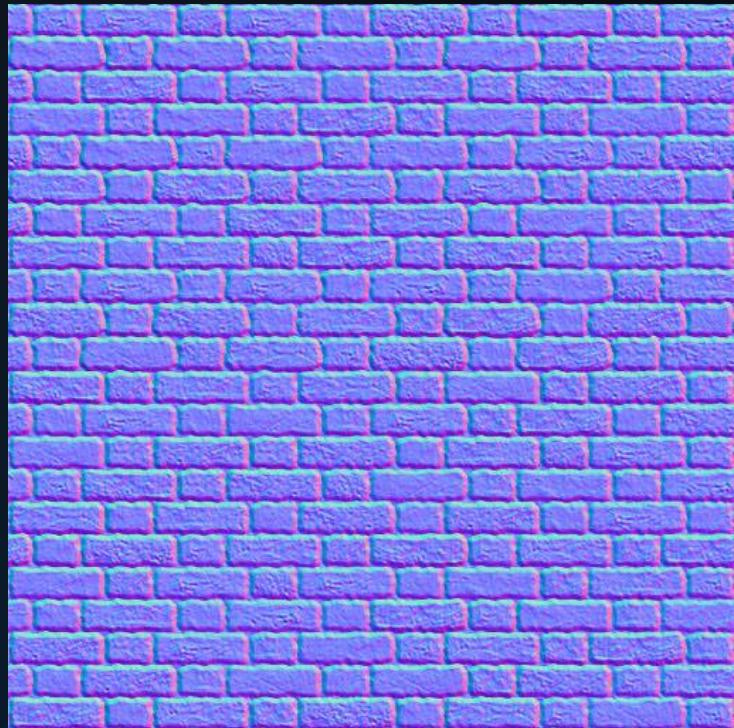

Bumps

Normal Maps

A normal map is similar to a texture:

- we use textures to lookup a color at a particular position on a mesh;
- we use normal to lookup a normal at a particular position.

Normal maps generally store normals in *tangent space*.

```
rics  
(depth < MAXDEPTH)  
  
    c = inside / t;  
    nt = nt / nc; ddc =  
    pos2t = 1.0f - nt;  
    D, N );

at3 factor = diffuse * INVPI;  
at weight = Mis2( directPpdf, brdfPpdf );  
at cosThetaOut = dot( N, L );  
E * ((weight * cosThetaOut) / directPpdf) * (radiance  
  
random walk - done properly, closely following  
alive)  
;  
at3 brdf = SampleDiffuse( diffuse, N, r1, r2, &R, spot  
survive;  
pdf;  
n = E * brdf * (dot( N, R ) / pdf);  
ision = true;
```

Bumps

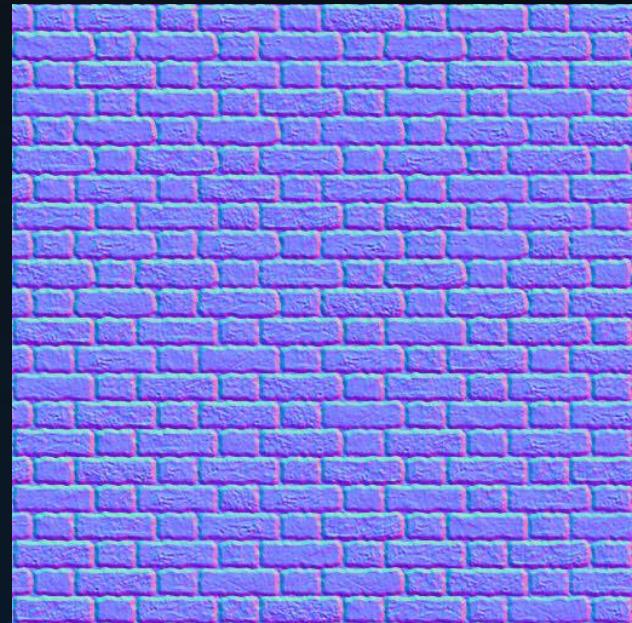

Normal Map Data

A normal map stores 2 or 3 components per texel.

For 3 components: $x, y, z \in [0..255]$.

To get this to the correct range:

- Cast to float
- Divide by 128 $\rightarrow x, y, z \in [0..2]$
- Subtract 1 $\rightarrow x, y, z \in [-1..1]$

Bumps

Normal Map Data

A normal map stores 2 or 3 components per texel.

For 2 components: $x, y \in [0..255]$.

To reconstruct the normal, we first apply the same conversion as we did for three components. Then:

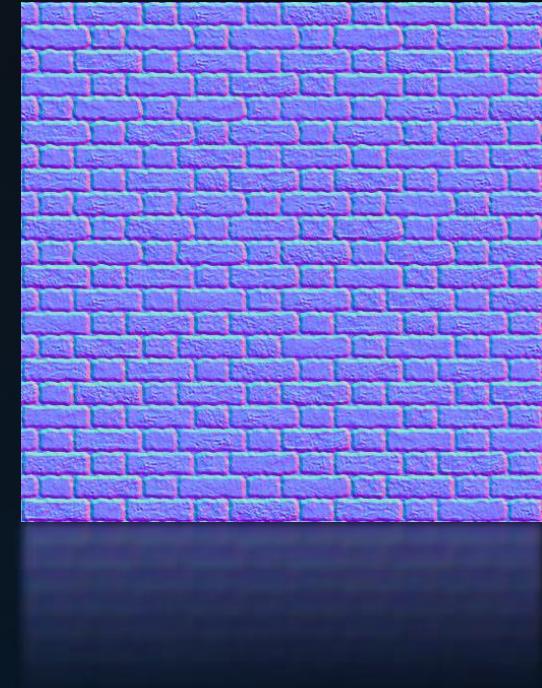

$$\sqrt{x^2 + y^2 + z^2} = 1$$

$$x^2 + y^2 + z^2 = 1$$

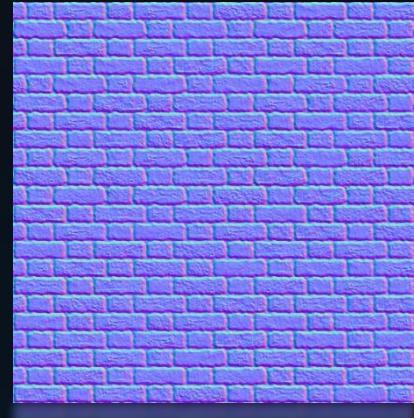

$$z^2 = 1 - (x^2 + y^2)$$

$$z = \pm\sqrt{1 - (x^2 + y^2)}$$

$$z = \sqrt{1 - (x^2 + y^2)}$$

Bumps

Tangent Space

Things are easy when $x = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$, $y = \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$ and $z = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$:

$$N = M_x x + M_y y + M_z z$$

$$= M_x \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} + M_y \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} + M_z \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} M_x \\ M_y \\ M_z \end{pmatrix}$$

Bumps

Tangent Space

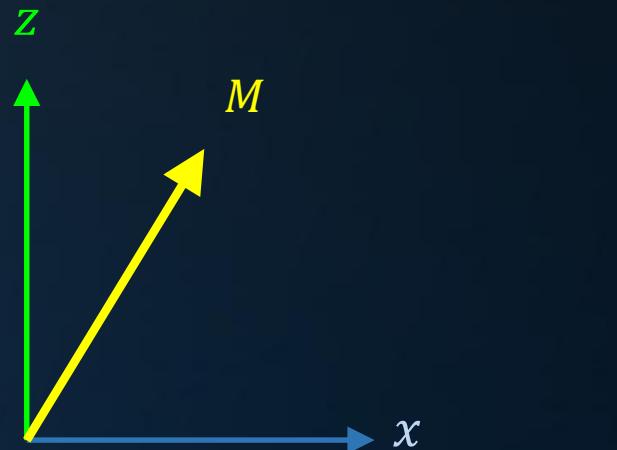

Things are still easy for arbitrary x, y and z :

$$N = M_x x + M_y y + M_z z$$

Obtaining this x, y and z :

- z = (interpolated) surface normal
- x is perpendicular to z
- y is perpendicular to z and x

See Crytek for details*.
